

OpenCPU User Guide

GSM/GPRS Module Series

Rev. OpenCPU_User_Guide_V5.1

Date: 2013-11-05

Our aim is to provide customers with timely and comprehensive service. For any assistance, please contact our company headquarter:

Quectel Wireless Solutions Co., Ltd.

Room 501, Building 13, No.99, Tianzhou Road, Shanghai, China, 200233

Tel: +86 21 5108 6236

Mail: info@quectel.com

Or our local office, for more information, please visit:

<http://www.quectel.com/support/salesupport.aspx>

For technical support, to report documentation errors, please visit:

<http://www.quectel.com/support/techsupport.aspx>

GENERAL NOTES

QUECTEL OFFERS THIS INFORMATION AS A SERVICE TO ITS CUSTOMERS. THE INFORMATION PROVIDED IS BASED UPON CUSTOMERS' REQUIREMENTS. QUECTEL MAKES EVERY EFFORT TO ENSURE THE QUALITY OF THE INFORMATION IT MAKES AVAILABLE. QUECTEL DOES NOT MAKE ANY WARRANTY AS TO THE INFORMATION CONTAINED HEREIN, AND DOES NOT ACCEPT ANY LIABILITY FOR ANY INJURY, LOSS OR DAMAGE OF ANY KIND INCURRED BY USE OF OR RELIANCE UPON THE INFORMATION. ALL INFORMATION SUPPLIED HEREIN ARE SUBJECT TO CHANGE WITHOUT PRIOR NOTICE.

COPYRIGHT

THIS INFORMATION CONTAINED HERE IS PROPRIETARY TECHNICAL INFORMATION OF QUECTEL CO., LTD. TRANSMITTABLE, REPRODUCTION, DISSEMINATION AND EDITING OF THIS DOCUMENT AS WELL AS UTILIZATION OF THIS CONTENTS ARE FORBIDDEN WITHOUT PERMISSION. OFFENDERS WILL BE HELD LIABLE FOR PAYMENT OF DAMAGES. ALL RIGHTS ARE RESERVED IN THE EVENT OF A PATENT GRANT OR REGISTRATION OF A UTILITY MODEL OR DESIGN.

5.1.3.	Possible Error Code	44
5.1.4.	Example	45
5.2.	Time API	46
5.2.1.	Usage	46

5.2.2.	API Functions	46
5.2.2.1.	QI_SetLocalTime	47
5.2.2.2.	QI_GetLocalTime	47
5.2.2.3.	QI_Mktime	48
5.2.2.4.	QI_MKTime2CalendarTime	48
5.2.3.	Example	49
5.3.	Timer API	49
5.3.1.	Usage	50
5.3.2.	API Functions	50
5.3.2.1.	QI_Timer_Register	50
5.3.2.2.	QI_Timer_RegisterFast	51
5.3.2.3.	QI_Timer_Start	51
5.3.2.4.	QI_Timer_Stop	52
5.3.3.	Example	52
5.4.	Power Management API	53
5.4.1.	Usage	53
5.4.1.1.	Power on/off	53
5.4.1.2.	Sleep Mode	53
5.4.2.	API Functions	54
5.4.2.1.	QI_PowerDown	54
5.4.2.2.	QI_LockPower	54
5.4.2.3.	QI_PwrKey_Register	54
5.4.2.4.	QI_SleepEnable	55
5.4.2.5.	QI_SleepDisable	56
5.4.3.	Example	56
5.5.	Memory API	56
5.5.1.	Usage	57
5.5.2.	API Functions	57
5.5.2.1.	QI_MEM_Alloc	57
5.5.2.2.	QI_MEM_Free	57
5.5.3.	Example	58
5.6.	File System API	58
5.6.1.	Usage	58
5.6.2.	API Functions	59
5.6.2.1.	QI_FS_Open	59
5.6.2.2.	QI_FS_OpenRAMFile	60
5.6.2.3.	QI_FS_Read	61
5.6.2.4.	QI_FS_Write	61
5.6.2.5.	QI_FS_Seek	62
5.6.2.6.	QI_FS_GetFilePosition	63
5.6.2.7.	QI_FS_Truncate	63
5.6.2.8.	QI_FS_Flush	64
5.6.2.9.	QI_FS_Close	64
5.6.2.10.	QI_FS_GetSize	65

5.6.2.11.	QI_FS_Delete	65
5.6.2.12.	QI_FS_Check	66
5.6.2.13.	QI_FS_Rename	66
5.6.2.14.	QI_FS_CreateDir	67
5.6.2.15.	QI_FS_DeleteDir	67
5.6.2.16.	QI_FS_CheckDir	68
5.6.2.17.	QI_FS_FindFirst	68
5.6.2.18.	QI_FS_FindNext	69
5.6.2.19.	QI_FS_FindClose	70
5.6.2.20.	QI_FS_XDelete	70
5.6.2.21.	QI_FS_XMove	71

1 Introduction

OpenCPU is an embedded development solution for M2M field that GSM/GPRS module can be designed as the main processor. And it has been designed to facilitate the design and accelerate the application development. OpenCPU makes it possible to create innovative applications and embed them directly into Quectel GSM/GPRS modules to run without external MCU. It has been widely used in M2M field, such as tracker & tracing, automotive, energy.

2 OpenCPU Platform

2.1. System Architecture

The following figure shows the fundamental principle of OpenCPU software architecture.

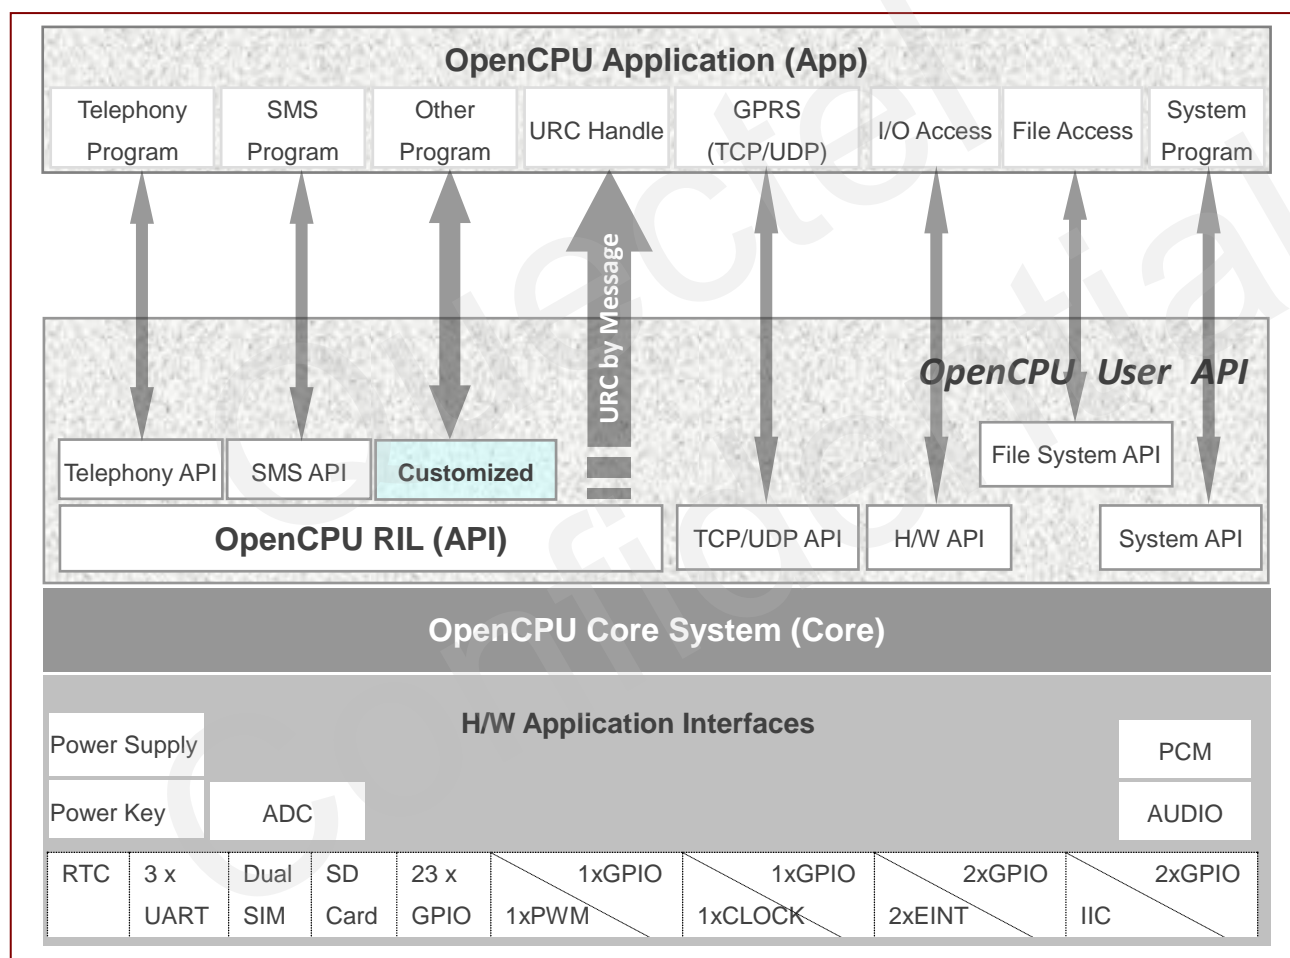

Figure 1: The Fundamental Principle of OpenCPU Software Architecture

PWM, CLOCK, EINT are multiplexing interfaces with GPIOs. IIC interface is simulated by two GPIO pins that developer can select from the GPIOs available.

OpenCPU Core System is a combination of hardware and software of GSM/GPRS module. It has built-in ARM7EJ-S processor, and has been built over Nucleus operating system, which has the characteristics of

micro-kernel, real-time, multi-tasking and etc.

OpenCPU User APIs are designed for access to hardware resources, radio communications resources, user file system, or external devices. All APIs are introduced in chapter 5.

OpenCPU RIL is an open source layer, which enables developer to simply call API to send AT and get the response when API returns. And besides, developer can easily add a new API to implement an AT command. Please also see “*OpenCPU RIL User Guide*” document.

In OpenCPU RIL, all URC messages of module have already reinterpreted and the result is informed App by system message. App will receive the message “*MSG_ID_URC_INDICATION*” when an URC arrives.

2.2. Open Resources

2.2.1. Processor

32-bit ARM7EJ-STM RISC 104MHz.

2.2.2. Memory Scheme

This memory scheme is for the OpenCPU module with 8MB-flash.

- User App Code Space: 640KB space available for image bin
- RAM Space: 2MB space available for application program
- User File System Space: 1MB available

2.3. Interfaces

2.3.1. Serial Interfaces

OpenCPU provides three UART ports: MAIN UART, DEBUG UART and AUX UART. They are also named as UART1, UART2 and UART3. Please see [\[5.7.1\]](#) for software API functions.

UART1 is a 9-pin serial interface with RTS/CTS HW handshake. UART2 and UART3 are 3-wire interface. UART2 has debug function that can debug the Core System. Please see [\[5.12\]](#).

2.3.2. GPIO

There're 23 I/O pins that can be configured for general purpose I/O. All pins can be accessed under OpenCPU by API functions. Please refer to [\[5.7.2\]](#) for details.

2.3.3. EINT

OpenCPU supports external interrupt input. There're two I/O pins that can be configured for external interrupt input. But the EINT cannot be used for the purpose of highly frequent interrupt detection, which causes module unstably working. The EINT pins can be accessed by APIs. Please refer to [\[5.7.3\]](#) for details.

2.3.4. PWM

There's one I/O pin that can be configured for PWM. There're 32K and 13M clock sources that are available. The PWM pin can be configured and controlled by APIs. Please refer to [\[5.7.4\]](#) for details.

2.3.5. CLOCK

There's one I/O pin that can be configured for clock out. And there is 32K, 5.6M, 13M and 26M clock sources that are available. The clock pin can be configured and controlled by APIs. Please refer to [\[5.7.5\]](#) for details.

2.3.6. ADC

There's an analogue input pins that can be configured for ADC. The sampling period and count can be configured by an API. Please see [\[5.7.6\]](#).

Please refer to the document [2] for the characteristics of ADC interface.

2.3.7. IIC

In OpenCPU, IIC interface is simulated by GPIO pins, which can be any two GPIOs in the GPIO list [\[5.7.2.2\]](#). So, one or more IIC interfaces are possible. Please refer to [\[5.7.7\]](#) for details.

2.3.8. SPI

SPI interface can be simulated by a group of GPIO pins. Please see [\[5.7.8\]](#).

2.3.9. Power Key

In OpenCPU, App can catch the behavior that power key is pressed down or released. Then developer may redefine the behavior of pressing power key. Please also see [\[4.4.1\]](#), [\[5.4.2.2\]](#) and [\[5.4.2.3\]](#).

2.3.10. SD Card

There's a group of pins designed for SD card interface. Please refer to the HD document [\[2\]](#).

2.4. Development Environment

2.4.1. SDK

OpenCPU SDK provides the resources as follows for developers:

- Compile environment.
- Development guide and other related documents.
- A set of header files that defines all API functions and type declaration.
- Source code for examples.
- Open source code for RIL.
- Download tool for application image bin.
- Pack tool for FOTA upgrade.

Customer may get the latest SDK package from sale channel.

2.4.2. Editor

Any text editor is available for editing codes, such Source Insight, visual studio and even notepad.

The Source Insight tool is recommended to edit and manage codes. Source Insight is an advanced code editor and browser with built-in analysis for C/C++ program, and provides syntax highlighting, code navigation and customizable keyboard shortcuts.

Please refer to appendix [\[6.3\]](#) for how to work with Visual Studio.

2.4.3. Compiler & Compiling

2.4.3.1. Compiler

OpenCPU uses GCC as compiler. And the compiler edition is "Sourcery CodeBench". The document "*OpenCPU GCC Install Guide*" tells how to establish GCC environment.

2.4.3.2. Compiling

In OpenCPU, compiling commands are executed in command line. The compiling and clean commands are defined as below.

```
make clean
make new
```

2.4.3.3. Compiling Output

In command-line, some compiler processing information will be output during compiling. All WARNING and ERROR are recorded in `\SDK\build\gcc\build.log` or `\SDK\build\rvct\build.log`.

So, if there exists any compiling error during compiling, please check the build.log for the error line number and the error hints.

For example, in line 195 in `example_at.c`, the semicolon is missed intentionally.

```
194 | // Handle the response...
195 | Ql_Debug_Trace("<-- Send 'AT+GSN' command, Response:%s -->\r\n\r\n", ATResponse)
196 | if (0 == ret)
```

When compiling this example program, a compiling error will be thrown out. In `build.log`, it goes like this:

```
example/example_at.c:196:5: error: expected ';' before 'if'
make.exe[1]: *** [build\gcc\obj/example/example_at.o] Error 1
make: *** [all] Error 2
```

If no any compiling error during compiling, the prompt for successfully compiling is given.

```
-----
- GCC Compiling Finished Sucessfully.
- The target image is in the 'build\gcc' directory.
-----
```

2.4.4. Download

The document “*Firmware_Upgrade_Tool_Lite_GS2_UGD*” tells the download tool and how to use it to download application bin.

2.4.5. How to Program

By default, the “custom” directory has been designed to store the customer source code files in SDK.

2.4.5.1. Program Composition

OpenCPU program consists of the aspects below.

Table 1: OpenCPU Program Composition

Item	Description
.h, .def files	Declarations for variables, functions and macros.
.c files	Source code implementations.
makefile	Define the destination object files and directories to compile.

2.4.5.2. Program Framework

The following codes are the least codes that comprise an OpenCPU Embedded Application.

```
/**
 * The entrance of this application.
 */
void proc_main_task(s32 taskId)
{
    ST_MSG msg;

    //START MESSAGE LOOP OF THIS TASK
    while (1)
    {
        QI_OS_GetMessage(&msg);
        switch(msg.message)
        {
            case MSG_ID_RIL_READY:
```

```

{
    QI_Debug_Trace("<-- RIL is ready -->\r\n");

    //Before use the RIL feature, you must initialize it by calling the following API
    //After receive the 'MSG_ID_RIL_READY' message.
    QI_RIL_Initialize();

    //Now you can start to send AT commands.
    Demo_SendATCmd();
    break;
}
case MSG_ID_URC_INDICATION:
{
    //QI_Debug_Trace("<-- Received URC: type: %d, -->\r\n", msg.param1);
    switch (msg.param1)
    {
        case URC_SYS_INIT_STATE_IND:
            QI_Debug_Trace("<-- Sys Init Status %d -->\r\n", msg.param2);
            break;
        case URC_SIM_CARD_STATE_IND:
            QI_Debug_Trace("<-- SIM Card Status:%d -->\r\n", msg.param2);
            break;
        case URC_GSM_NW_STATE_IND:
            QI_Debug_Trace("<-- GSM Network Status:%d -->\r\n", msg.param2);
            break;
        case URC_GPRS_NW_STATE_IND:
            QI_Debug_Trace("<-- GPRS Network Status:%d -->\r\n", msg.param2);
            break;
        case URC_CFUN_STATE_IND:
            QI_Debug_Trace("<-- CFUN Status:%d -->\r\n", msg.param2);
            break;
        case URC_COMING_CALL_IND:
            {
                ST_ComingCall* pComingCall = (ST_ComingCall*)msg.param2;
                QI_Debug_Trace("<-- Coming call, number:%s, type:%d -->\r\n",
pComingCall->phoneNumber, pComingCall->type);
                break;
            }
        case URC_CALL_STATE_IND:
            switch (msg.param2)
            {
                case CALL_STATE_BUSY:
                    QI_Debug_Trace("<-- The number you dialed is busy now -->\r\n");
                    break;
            }
    }
}

```

```
case CALL_STATE_NO_ANSWER:
    QI_Debug_Trace("<-- The number you dialed has no answer -->\r\n");
    break;
case CALL_STATE_NO_CARRIER:
    QI_Debug_Trace("<-- The number you dialed cannot reach -->\r\n");
    break;
case CALL_STATE_NO_DIALTONE:
    QI_Debug_Trace("<-- No Dial tone -->\r\n");
    break;
default:
    break;
}
break;
case URC_NEW_SMS_IND:
    QI_Debug_Trace("<-- New SMS Arrives: index=%d\r\n", msg.param2);
    break;
case URC_MODULE_VOLTAGE_IND:
    QI_Debug_Trace("<-- VBatt Voltage Ind: type=%d\r\n", msg.param2);
    break;
default:
    QI_Debug_Trace("<-- Other URC: type=%d\r\n", msg.param1);
    break;
}
break;
}
//
//Case other user message ID...
//
default:
    break;
}
}
}
```

The *proc_main_task* function is the entrance of Embedded Application, just like the *main ()* in C application.

QI_OS_GetMessage is an important system function that the Embedded Application receives messages from message queue of the task.

MSG_ID_RIL_READY is a system message that RIL module sends to main task.

MSG_ID_URC_INDICATION is a system message that indicates a new URC coming.

2.4.5.3. Makefile

In OpenCPU, compiler compiles program according to the definitions in makefile. The profile of makefile has been pre-designed and is ready for use. However, developer needs to change some settings before compiling program according to native conditions, such as compiler environment path.

`\SDK\make\gcc\gcc_makefile\gcc_makefile` needs to be maintained. This makefile mainly includes:

- Environment path definition of compiler
- Preprocessor definitions
- Definitions for include search paths
- Source code directories and files to compile
- Lib files to link

2.4.5.4. How to Add .c File

Suppose that the new file is in “custom” directory, the newly added .c files will be compiled automatically.

2.4.5.5. How to Add Directory

If developer needs to add new directory in “custom”, please follow the steps below.

First, add the new directory name in variable “SRC_DIRS” in `\SDK\make\gcc\gcc_makefile\gcc_makefile`. And define the source code files to compile.

```
#-----  
# Configure source code directories  
#-----  
SRC_DIRS=example \  
          custom \  
          custom\config \  
          ril\src \
```

Secondly, define the source code files to compile in the new directory.

```
SRC_SYS=$(wildcard custom/config/*.c)  
SRC_SYS_RIL=$(wildcard ril/src/*.c)  
SRC_EXAMPLE=$(wildcard example/*.c)  
SRC_CUS=$(wildcard custom/*.c)
```

```
OBJS=\
$(patsubst %.c, $(OBJ_DIR)/%.o, $(SRC_SYS))      \
$(patsubst %.c, $(OBJ_DIR)/%.o, $(SRC_SYS_RIL))   \
$(patsubst %.c, $(OBJ_DIR)/%.o, $(SRC_CUS))       \
$(patsubst %.c, $(OBJ_DIR)/%.o, $(SRC_EXAMPLE))   \
```

3 Basic Data Types

3.1. Required Header

In OpenCPU, the base data types are defined in the `ql_type.h` header file.

3.2. Base Data Type

Table 2: Base Data Type

Type	Description
bool	Boolean variable (should be TRUE or FALSE). This variable is declared as follows: <code>typedef unsigned char bool;</code>
s8	8-bit signed integer. This variable is declared as follows: <code>typedef signed char s8;</code>
u8	8-bit unsigned integer. This variable is declared as follows: <code>typedef unsigned char u8;</code>
s16	16-bit signed integer. This variable is declared as follows: <code>typedef signed short s16;</code>
u16	16-bit unsigned integer. This variable is declared as follows: <code>typedef unsigned short u16;</code>
s32	32-bit signed integer. This variable is declared as follows: <code>typedef int s32;</code>
u32	32-bit unsigned integer. This variable is declared as follows: <code>typedef unsigned int u32;</code>

u64	64-bit unsigned integer. This variable is declared as follows: <code>typedef unsigned long long u64;</code>
float	Floating-point variable. This variable is declared in math.h.

Quectel

4 System Configuration

In the `\SDK\custom\config` directory, developer can reconfigure the application according to requirements, such as heap memory size, add tasks and stack size of tasks, GPIO initial status. All configuration files for developer are named with prefix “custom_”.

Table 3: System Config File List

Config File	Description
custom_feature_def.h	OpenCPU features enable. Now only include RIL. Developers generally don't need to change this file.
custom_gpio_cfg.h	Configurations for GPIO initial status.
custom_heap_cfg.h	Definition of heap size
custom_task_cfg.h	Multitask config
custom_sys_cfg.c	Other system config, include power key, emerg_off, specify GPIO pin for external watchdog, and set working mode of debug port.

4.1. Configuration for Heap Size

Since the demand of heap size is different from application to application. OpenCPU allows developer to configure the heap size according to the real requirement. Developer may simply modify the value of “HEAP_MEMSIZE” that is defined in “custom_heap_cfg.h” file.

The value of heap size of application ranges from 1 to the maximum memory size available. Unit is byte.

```
#define HEAP_MEMSIZE (30 * 1024)
```

4.2. Configuration for Tasks

OpenCPU supports multitask processing. Developers only need to simply follow suit to add a record in “custom_task_cfg.h” file to define a new task. OpenCPU supports one main task, and maximum TEN

subtasks.

If there exists file operations in task, the stack size must be set to at least 5KB.

Developer should avoid calling these functions: “QI_Sleep()”, “QI_OS_TakeSemaphore()” and “QI_OS_TakeMutex()”. These functions will block the task, so that the task cannot fetch message from the message queue. If the message queue is filled up, the system will automatically reboot unexpectedly.

4.3. Configuration for GPIO

In OpenCPU, there're two ways to initialize GPIOs. One is to configure initial GPIO list in “custom_gpio_cfg.h”; the other way is to call GPIO related API (please see [5.7.2]) to initialize after App starts. But the previous is earlier than the latter on time sequence. The following figure shows the time sequence relationship.

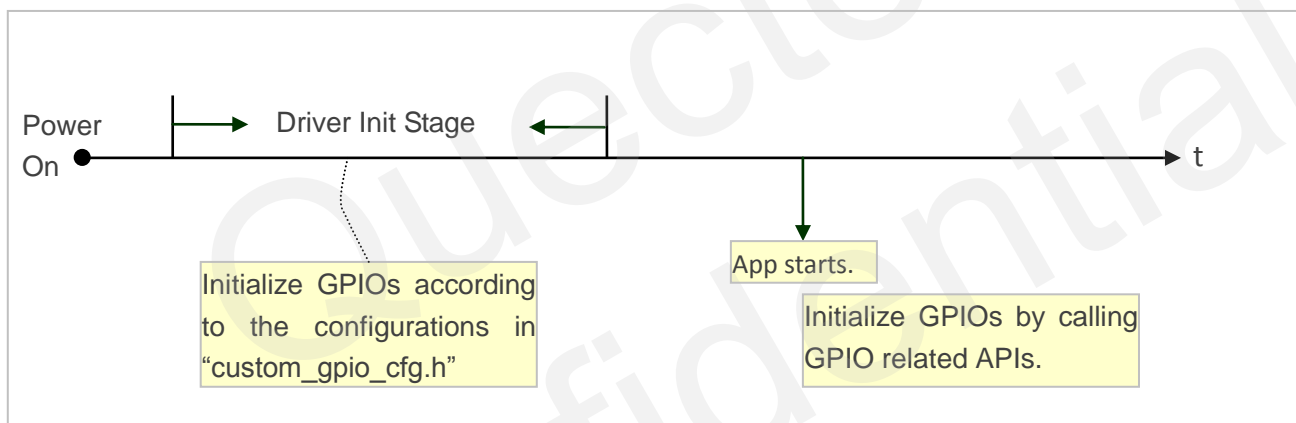

Figure 2: Time Sequence for GPIO Initialization

4.4. Configuration for Customizations

All customization items are configured in TLV (Type-Length-Value) in “custom_sys_cfg.c”. Developer may change App’s features by changing the value.

```
const ST_SystemConfig SystemCfg[] = {
    {SYS_CONFIG_APP_ENABLE_ID,      SYS_CONFIG_APPENABLE_DATA_SIZE,
      (void*)&appEnableCfg},
    {SYS_CONFIG_PWRKEY_DATA_ID,     SYS_CONFIG_PWRKEY_DATA_SIZE,
      (void*)&pwrkeyCfg  },
    {SYS_CONFIG_EMERGOFF_DATA_ID,   SYS_CONFIG_EMERGOFF_DATA_SIZE,
```

```
(void*)&emergoffCfg },
{SYS_CONFIG_WATCHDOG_DATA_ID, SYS_CONFIG_WATCHDOG_DATA_SIZE,
(void*)&wtdCfg },
{SYS_CONFIG_DEBUG_MODE_ID, SYS_CONFIG_DEBUGMODE_DATA_SIZE,
(void*)&debugPortCfg},
{SYS_CONFIG_END, 0,
NULL
};
```

Table 4: Customization Item

Item	Type(T)	Length(L)	Default Value	Possible Value	Description
App Enable	SYS_CONFIG_APP_ENABLE_ID	4	APP_ENABLE	APP_ENABLE APP_DISABLE	App enable config
PWRKEY Pin Config	SYS_CONFIG_PWRKEY_DATA_ID	2	TRUE TRUE	TRUE/FALSE	Power on/off working mode, see 4.4.1
EMERG_OFF Pin Config	SYS_CONFIG_EMERGOFF_DATA_ID	4		EMERGOFF_POWEROFF EMERGOFF_RESET	Emerg_off working mode, see 4.4.2
GPIO for WTD Config	SYS_CONFIG_WATCHDOG_DATA_ID	8	PINNAME_GPIO0	One value of Enum_PinName	GPIO for feeding WTD, see 4.4.3
Working Mode for Debug Port	SYS_CONFIG_DEBUG_MODE_ID	4	BASIC_MODE	BASIC_MODE ADVANCE_MODE	Application mode or debug mode

4.4.1. Power Key Config

```
static const ST_PowerKeyCfg pwrkeyCfg =
{
```

```
    TRUE, //Working mode for power-on on PWRKEY pin
    /*
```

Module automatically powers on when feeding a low level to POWER_KEY pin.

When set to FALSE, the callback that QI_PwrKey_Register registers will be triggered. Application must call QI_LockPower () to lock power supply, or module will lose power when the level of PWRKEY pin goes high.

```
*/
```

```
TRUE, //Working mode for power-off on PWRKEY pin
/*
Module automatically powers off when feeding a low level to POWER_KEY pin.

When set to FALSE, the callback that Ql_PwrKey_Register registers will be triggered.
Application may do post processing before switches off the module.
*/
};
```

For example, if the “pwrKeyCfg” is configured as below.

```
static const ST_PowerKeyCfg pwrkeyCfg =
{
    FALSE, //Working mode for power-on on PWRKEY pin
    FALSE, //Working mode for power-off on PWRKEY pin
};
```

When switching on/off the module by feeding a low level to POWER_KEY, the callback in application will be triggered. The example codes are shown below.

```
...
//Register a callback function for pressing POWER KEY.
Ql_PwrKey_Register((Callback_PowerKey_Ind)callback_pwrKey_ind);
...
//Callback definition
void Callback_PowerKey_Hdlr(s32 param1, s32 param2)
{
    Ql_Debug_Trace("<-- Power Key: %s, %s -->\r\n",
        param1==POWER_OFF ? "Power Off":"Power On",
        param2==KEY_DOWN ? "Key Down":"Key Up"
    );
    if (POWER_ON==param1)
    {
        Ql_Debug_Trace("<-- App Lock Power Key! -->\r\n");
        Ql_LockPower();
    }
    else if (POWER_OFF==param1)
    {
        //Post processing before power down
        //...
        //Power down
        Ql_PowerDown();
    }
}
```

```
}
```

4.4.2. EMERG_OFF Config

EMERG_OFF pin can work in two ways. One is “POWER DOWN” mode, and the other is “RESET” mode, which is the default value.

```
static const ST_EmergOffCfg emergoffCfg = {
    EMERGOFF_RESET
};
```

In EMERGOFF_RESET mode, when a low level is fed to EMERG_OFF pin, the module resets.

In EMERGOFF_POWEROFF mode, when a low level is fed to EMERG_OFF pin, the module powers down.

NOTE

The configuration on emerg_off pin is based on the power key isn't connected to GND directly.

4.4.3. GPIO for External Watchdog

When an external watchdog is adopt to monitoring the application, the module has to feed the watchdog in whole period that module is in power up, including the boot course, App active course, and App upgrade course.

Table 5: Participant for Feed External Watchdog

Period	Feeding Host
Bootting	Core system
App Running	App
Upgrading App By FOTA	Core system

So, developer just needs to specify which GPIO is designed to feed the external watchdog.

```
static const ST_ExtWatchdogCfg wtdCfg = {
    PINNAME_GPIO0, //Specify a pin which connects to the external watchdog, other GPIO is ok.
    PINNAME_END    //Specify another pin for watchdog if needed
```

```
};
```

4.4.4. Debug Port Working Mode Config

The serial debug port (UART2) may work as a common serial port (BASIC_MODE), as well as work as a special debug port (ADVANCE_MODE) that can debug some issues underlay application.

Usually developer doesn't need to use ADVANCE_MODE without the requirements from support engineer. If needed, please refer to the document "*Catcher_Operation_UGD*" for the usage of the special debug mode.

5 API Functions

5.1. System API

The “ql_system.h” file declares system-related APIs. These functions are essential to any customer’s applications. Make sure to include the header file.

OpenCPU supports multitasking, message, mutex, semaphore and event mechanism. These interfaces are used for multitask programming. The example “example_multitask.c” in OpenCPU SDK shows the proper usages of these API functions.

5.1.1. Usage

This section introduces some important operations and the API function in system-level programming.

5.1.1.1. Receive Message

Developers can call `QI_OS_GetMessage` to retrieve a message from the current task's message queue. The message can be a system message, and also can be a customized message.

5.1.1.2. Send Message.

Developers can call `QI_OS_SendMessage` to send messages to other tasks. To send message, developers have to define a message id. In OpenCPU, user message id must bigger than 0x1000.

Step 1: Define message ID.

```
#define MSG_ID_USER_START 0x1000
#define MSG_ID_MESSAGE1 (MSG_ID_USER_START + 1)
```

Step 2: Send message.

```
QI_OS_SendMessage(ql_subtask1, MSG_ID_MESSAGE1, 0, 0);
```

5.1.1.3. Mutex

A mutex object is a synchronization object whose state is set to signaled when it is not owned by any task, and non-signaled when it is owned. Only one task at a time can own a mutex object. For example, to prevent two tasks from writing to shared memory at the same time, each task waits for ownership of a mutex object before executing the code that accesses the memory. After writing to the shared memory, the task releases the mutex object.

Step 1: Create mutex. Developers can call `QI_OS_CreateMutex` to create a mutex.

Step 2: Get mutex. If developers want to use mutex mechanism for programming, they can call `QI_OS_TakeMute` to get the specified mutex ID.

Step 3: Give Mutex. Developers can call `QI_OS_GiveMutex` to release the specified mutex.

5.1.1.4. Semaphore

A semaphore object is a synchronization object that maintains a count between zero and a specified maximum value. The count is decremented each time a task completes a wait for the semaphore object and incremented each time a task releases the semaphore. When the count reaches zero, no more tasks can successfully wait for the semaphore object state to become signaled. The state of a semaphore is set to signaled when its count is greater than zero and non-signaled when its count is zero.

Step 1: Create Semaphore. Developers can call `QI_OS_CreateSemaphore` to create a semaphore.

Step 2: Get Semaphore. If developers want to use semaphore mechanism for programming, they can call `QI_OSTakeSemaphore` to get the specified semaphore ID.

Step 3: Give Semaphore. Developers can call `QI_OS_GiveSemaphore` to release the specified semaphore.

5.1.1.5. Event

An event object is a synchronization object, which is useful in sending a signal to a thread indicating that a particular event has occurred. A task uses `QI_OS_CreateEvent` function to create an event object, whose state can be explicitly set to signaled by use of the `QI_OS_SetEvent` function.

5.1.1.6. Backup Critical Data

OpenCPU has designed 13 blocks of system storage space to backup critical user data. Among the storage blocks, 1~8 blocks can store 50 bytes for each block, 9~12 blocks can store 100 bytes for each block, and the 13th block can store 500 bytes.

Developer may call `QI_Userdata_Backup()` to backup data, and call `QI_Userdata_Read()` to read back

data from backup space.

5.1.2. API Functions

5.1.2.1. QI_Reset

This function resets the system.

- **Prototype**

```
void QI_Reset(s32 resetType)
```

- **Parameters**

resetType:

[in] Must be 0.

- **Return Value**

None.

5.1.2.2. QI_Sleep

This function suspends the execution of the current task until the time-out interval elapses. The sleep time should not exceed 500 ms, because if the task is suspended too long, and it may receive too many messages to be crushed.

- **Prototype**

```
void QI_Sleep(u32 msec)
```

- **Parameters**

msec:

[in] The time interval for which execution is to be suspended is in milliseconds.

- **Return Value**

None.

5.1.2.3. QI_GetUID

This function gets the module UID. UID is a 20-bytes serial number identification. The probability that different module has same UID is 1ppm (1/10000000).

- **Prototype**

```
s32 QI_GetUID(u8* ptrUID, u32 len)
```

- **Parameters**

ptrUID:

[in] Point to the buffer which is used to store the UID. Need at least 20 bytes length of buffer.

len:

[in] The “ptrUID” buffer length. The value must less than or equal the buffer size that “ptrVer” point.

- **Return Value**

If the ptrUID is null, this function will return QL_RET_ERR_INVALID_PARAMETER. If this function read the UID successfully, the length of UID will be returned.

5.1.2.4. QI_GetCoreVer

This function gets the version ID of the core. The core version ID is a no more than 35 characters string, and it is end with '\0'.

- **Prototype**

```
s32 QI_GetCoreVer(u8* ptrVer, u32 len)
```

- **Parameters**

ptrVer:

[in] Point to the buffer which is used to store the version ID of the core. Need at least 35 bytes of the buffer.

len:

[in] The “ptrVer” buffer length. The value must less than or equal the buffer size that “ptrVer” point.

- **Return Value**

The return value is the length of version ID of the core if this function succeeds. Otherwise, the return value is an error code. To get extended error information, please see ERROR CODES.

5.1.2.5. QI_GetSDKVer

This function gets the version ID of the SDK. The SDK version ID is no more than 20 characters string, and it is end with '\0'.

- **Prototype**

```
s32 QI_GetSDKVer(u8* ptrVer, u32 len)
```

- **Parameters**

ptrVer:

[in] Point to the buffer which is used to store the version ID of the SDK. Need at least 20 bytes of the buffer.

len:

[in] The “ptrVer” buffer length. The value must less than or equal the buffer size that “ptrVer” point.

- **Return Value**

The return value is the length of version ID if this function succeeds. Otherwise, the return value is an error code. To get extended error information, please see ERROR CODES.

5.1.2.6. QI_GetMsSincePwrOn

This function returns the number of milliseconds since the device booted.

- **Prototype**

```
u64 QI_GetMsSincePwrOn (void)
```

- **Parameters**

None.

- **Return Value**

Number of milliseconds.

5.1.2.7. QI_OS_GetMessage

This function retrieves a message from the current task's message queue. When there is no message in the task's message queue, the task is in the waiting state.

- **Prototype**

```
s32 QI_OS_GetMessage(ST_MSG* msg)
```

```
typedef struct {  
    u32  message;  
    u32  param1;  
    u32  param2;  
    u32  srcTaskId;  
} ST_MSG;
```

- **Parameters**

msg:

[in] Point to a "ST_MSG" object.

- **Return Value**

QL_RET_OK.

5.1.2.8. QI_OS_SendMessage

This function sends messages between tasks. The destination task receives messages with *QI_OS_GetMessage*.

- **Prototype**

```
s32 QI_OS_SendMessage (s32 destTaskId, u32 msgId, u32 param1, u32 param2)
```

- **Parameters**

desttaskid:

[in] The maximum value is 10. The destination task is main task if the value is 0. The destination task is subtask if the value is between 1 and 10.

param1:

[in] User data.

param2:

[in] User data.

- **Return Value**

OS_SUCCESS: send message succeeds.

5.1.2.9. QI_OS_CreateMutex

This function creates a mutex. A handle of be created mutex will be returned if create success. 0 indicates failure. If the same mutex is already created, this function may return a valid handle also. But the QI_GetLastError function returns "ERROR_ALREADY_EXISTS".

- **Prototype**

```
u32 QI_OS_CreateMutex(char *mutexName)
```

- **Parameters**

mutexName:

[in] Name of the mutex to be created.

- **Return Value**

A handle of be created mutex, 0 indicates failure.

5.1.2.10. QI_OS_TakeMutex

This function obtains an instance of the specified mutex. If the mutex id is invalid, the system may be crush.

- **Prototype**

```
void QI_OS_TakeMutex(u32 mutexId)
```

- **Parameters**

mutexid:

[in] Destination mutex to be taken.

- **Return Value**

None.

5.1.2.11. QI_OS_GiveMutex

This function releases an instance of the specified mutex.

- **Prototype**

```
void QI_OS_GiveMutex(u32 mutexId)
```

- **Parameters**

mutexid:

[in] Destination mutex to be given.

- **Return Value**

None.

5.1.2.12. QI_OS_CreateSemaphore

This function creates a counting semaphore. A handle of be created semaphore will be returned, if create success. 0 indicates failure. If the same semaphore is already created, this function may return a valid handle also. But the QI_GetLastError function returns "ERROR_ALREADY_EXISTS".

- **Prototype**

```
u32 QI_OS_CreateSemaphore(char *semName, u32 maxCount)
```

- **Parameters**

semname:

[in] Name of the semaphore to be created.

maxCount:

[in] The max count of semaphore.

- **Return Value**

A handle of be created semaphore. 0 indicates failure.

5.1.2.13. QI_OS_TakeSemaphore

This function obtains an instance of the specified semaphore. If the mutexid is invalid, the system may be crush.

- **Prototype**

```
u32 QI_OSTakeSemaphore(u32 semId, bool wait)
```

- **Parameters**

semId:

[in] The destination semaphore to be taken.

wait:

[in] The waiting style determines if a task waits infinitely (TRUE) or returns immediately (FALSE).

- **Return Value**

OS_SUCCESS: the operation is done successfully.

OS_SEM_NOT_AVAILABLE: the semaphore is unavailable immediately.

5.1.2.14. QI_OS_CreateEvent

This function waits until the specified type of event is in the signaled state. Developers can specify different types of events for purposes. The event flags are defined in "Enum_EventFlag".

- **Prototype**

```
u32 QI_OS_CreateEvent(char* evtName);
```

- **Parameters**

evtName:

[in] Event name.

- **Return Value**

An event ID identifies this event is unique.

5.1.2.15. QI_OS_WaitEvent

This function waits until the specified type of event is in the signaled state. Developers can specify different types of events for purposes. The event flags are defined in "Enum_EventFlag".

- **Prototype**

```
s32 QI_OS_WaitEvent(u32 evtId, u32 evtFlag);
```

- **Parameters**

evtId:

Event ID that is returned by calling QI_OS_CreateEvent().

evtFlag:

Event flag type. Please refer to "Enum_EventFlag".

- **Return Value**

Zero indicates success, nonzero means failure.

5.1.2.16. QI_OS_SetEvent

This function sets the specified event flag. Any task waiting on the event, whose event flag request is satisfied, is resumed.

- **Prototype**

```
s32 QI_OS_SetEvent(u32 evtId, u32 evtFlag);
```

- **Parameters**

evtId:

Event ID that is returned by calling QI_OS_CreateEvent().

evtFlag:

Event flag type. Please refer to "Enum_EventFlag".

- **Return Value**

Zero indicates success, nonzero means failure.

5.1.2.17. QI_OS_GiveSemaphore

This function releases an instance of the specified semaphore.

```
void QI_OS_GiveSemaphore(u32 semId)
```

- **Parameters**

semId:

[in] The destination semaphore to be given.

- **Return Value**

None.

5.1.2.18. QI_SetLastErrorCode

This function sets error code.

- **Prototype**

```
s32 QI_SetLastErrorCode(s32 errCode)
```

- **Parameters**

errCode:

[in] Error code.

- **Return Value**

QL_RET_OK: indicates success.

QL_RET_ERR_FATAL: fail to set error code.

5.1.2.19. QI_GetLastErrorCode

This function retrieves the calling task's last-error code value.

- **Prototype**

```
s32 QI_GetLastErrorCode(void)
```

- **Parameters**

None.

- **Return value**

The return value is the calling task's last-error code.

5.1.2.20. QI_OS_GetCurrentTaskLeftStackSize

This function gets the left number of bytes in the current task stack.

- **Prototype**

```
u32 QI_OS_GetCurrentTaskLeftStackSize(void)
```

- **Parameters**

None.

- **Return Value**

The return value is number of bytes if this function succeeds. Otherwise an error code is returned.

5.1.2.21. QI_Userdata_Backup

This function can be used to backup some critical user data to prevent them from losing. OpenCPU has designed 13 blocks of system storage space to backup critical user data. Developer may specify the first parameter index [1-13] to specify different storage block. Among the storage blocks, 1~8 blocks can store 50 bytes for each block, 9~12 blocks can store 100 bytes for each block, and the 13th block can store 500 bytes.

- **Prototype**

```
s32 QI_Userdata_Backup(u8 index , u8 *pUserData, s32 len,OCPU_UserData_CB BackUp_CB);  
typedef void (*OCPU_UserData_CB)(s8 result, u8* pUserData, s32 len);
```

- **Parameters**

index:

[in] The index of the user data. The range is: 1~13.

user_data:

[in] The data to be backed up. In 1~8 groups, every group can save 50 bytes at most. In 9~12 groups, every group can save 100 bytes at most. If index is 13, the user data can save 500 bytes at most.

len

[in] The length of the user data. When the index is (1~8), then len<=50. When the index is (9~12), then len<=100. When the index is 13, then len<=500.

OCPU_UserData_CB:

[callback function] Whether the user data backup success

- **Return Value**

QL_RET_OK: succeeds.

QL_RET_ERR_PARAM: invalid parameter.

5.1.2.22. QI_Userdata_Read

This function read user data which is backed up by QI_Userdata_Backup API.

- **Prototype**

```
s32 QI_Userdata_Read(u8 index, s32 len, OCPU_UserData_CB UserData_Read_CB);
```

- **Parameters**

index:

[in] The index of the user data. The range is: 1~13.

len:

[in] The length of the user data. When the index is (1~8), then len<=50. When the index is (9~12), then len<=100. When index is 13, then len<=500.

OCPU_UserData_CB:

[callback function] Whether the user data read success, and return the user data.

- **Return Value**

QL_RET_OK: succeeds.

QL_RET_ERR_PARAM: invalid parameter.

5.1.3. Possible Error Code

The frequent error-codes, which APIs in multitask programming could return, are enumerated in the "Enum_OS_ErrCode".

```
/******  
* Error Code Definition
```

```
*****/
typedef enum {
    OS_SUCCESS,
    OS_ERROR,
    OS_Q_FULL,
    OS_Q_EMPTY,
    OS_SEM_NOT_AVAILABLE,
    OS_WOULD_BLOCK,
    OS_MESSAGE_TOO_BIG,
    OS_INVALID_ID,
    OS_NOT_INITIALIZED,
    OS_INVALID_LENGTH,
    OS_NULL_ADDRESS,
    OS_NOT_RECEIVE,
    OS_NOT_SEND,
    OS_MEMORY_NOT_VALID,
    OS_NOT_PRESENT,
    OS_MEMORY_NOT_RELEASE
} Enum_OS_ErrCode;
```

5.1.4. Example

1. Mutex example:

```
static int s_iMutexId = 0;

//Create the mutex first
s_iMutexId = QI_OS_CreateMutex("MyMutex");

void MutexTest(int iTaskId) //Two task Run this function at the same time
{
    //Get the mutex
    QI_OS_TakeMutex(s_iMutexId);

    //Another Caller prints this sentence after 3 seconds
    QI_Sleep(3000);

    //3 seconds later release the mutex.
    QI_OS_GiveMutex(s_iMutexId);
}
```

2. Semaphore example:

```
static int s_iSemaphoreId = 0; //Defined a semaphore Id.
```

```
static int s_iTestSemNum =4; //Set the maximum semaphore number is 4

//Create a semaphore first.
s_iSemaphoreId = QI_OS_CreateSemaphore("MySemaphore", s_iTestSemNum);
void SemaphoreTest(int iTaskId)
{
    int iRet = -1;

    //Get the mutex
    iRet = QI_OS_TakeSemaphore(s_iSemaphoreId, TRUE);//TRUE or FLASE indicate the task should
    wait infinitely or return immediately.
    QI_OS_TakeMutex(s_iSemMutex);
    s_iTestSemNum--; //One semaphore is be used
    QI_OS_GiveMutex(s_iSemMutex);

    QI_Sleep(3000);

    //3 seconds later release the semaphore.
    QI_OS_GiveSemaphore(s_iSemaphoreId);
    s_iTestSemNum++; // one semaphore is released.
    QI_Debug_Trace("\r\n<-----Task[%d]: s_iTestSemNum=%d-->", iTaskId, s_iTestSemNum);
}
```

5.2. Time API

OpenCPU module provides time-related APIs including setting local time, getting local time, converting the calendar time into seconds or converting seconds into the calendar time, etc.

5.2.1. Usage

Calendar time is measured from a standard point in time to the current time elapsed seconds, generally use at 00:00:00 on January 1, 1970 as a standard point in time.

5.2.2. API Functions

Time struct is defined as below:

```
typedef struct {
    s32 year;           //Range:2000~2127
    s32 month;
    s32 day;
    s32 hour;           //In 24-hour time system
```

```
s32 minute;  
s32 second;  
s32 timezone;    //Range: -12~12  
}ST_Time;
```

The field “timezone” defines the time zone. A negative number indicates the western time zone, and a positive number indicates the Eastern Time zone. For example: the time zone of Beijing is East Area 8, timezone=8; the time zone of Washington is West Zone 5, timezone=-5.

5.2.2.1. QI_SetLocalTime

Set the current local date and time.

- **Prototype**

```
s32 QI_SetLocalTime(ST_Time *datetime)
```

- **Parameter**

datetime:

[in] Point to the ST_Time object.

- **Return Value**

QL_RET_OK: indicates this function is executed successfully.

QL_RET_ERR_PARAM: indicates the parameter is error.

5.2.2.2. QI_GetLocalTime

Get the current local date and time.

- **Prototype**

```
ST_Time * QI_GetLocalTime(ST_Time * dateTime)
```

- **Parameter**

dateTime:

[Out] Point to the ST_Time object.

- **Return Value**

If succeed, return the current local date and time. NULL means failure.

5.2.2.3. QI_Mktime

This function gets the total seconds elapsed since 1970.01.01 00:00:00.

- **Prototype**

```
u64 QI_Mktime(ST_Time *dateTime)
```

- **Parameter**

dateTime:

[in] Point to the ST_Time object.

- **Return Value**

Return the total seconds.

5.2.2.4. QI_MKTime2CalendarTime

This function converts the seconds elapsed since 1970.01.01 00:00:00 to the local date and time.

- **Prototype**

```
ST_Time *QI_MKTime2CalendarTime(u64 seconds, ST_Time *pOutDateTime)
```

- **Parameter**

seconds:

[in] The seconds elapsed since 1970.01.01 00:00:00.

pOutDateTime:

[Out] Point to the ST_Time object.

- **Return Value**

If succeed, return the current local date and time, NULL means operation failure.

5.2.3. Example

The following code shows how to use the time-related APIs.

```
s32 ret;
u64 sec;
ST_Time datetime, *tm;
datetime.year=2013;
datetime.month=6;
datetime.day=12;
datetime.hour=18;
datetime.minute=12;
datetime.second=13;
datetime.timezone=-8;

//Set local time
ret=QI_SetLocalTime(&datetime);
QI_Debug_Trace("\r\n<--QI_SetLocalTime,ret=%d -->\r\n",ret);
QI_Sleep(5000);

//Get local time
tm=QI_GetLocalTime(&datetime);
QI_Debug_Trace("<--%d/%d/%d %d:%d:%d %d -->\r\n",tm->year, tm->month, tm->day, tm->hour, tm->minute, tm->second, tm->timezone);

//Get total seconds elapsed since 1970.01.01 00:00:00
sec=QI_Mktime(tm);
QI_Debug_Trace("\r\n<--QI_Mktime,sec=%lld -->\r\n",sec);

//Convert the seconds elapsed since 1970.01.01 00:00:00 to local date and time
tm=QI_MKTime2CalendarTime(sec, & datetime);
QI_Debug_Trace("<--%d/%d/%d %d:%d:%d %d -->\r\n",tm->year, tm->month, tm->day, tm->hour, tm->minute, tm->second, tm->timezone);
```

5.3. Timer API

OpenCPU provides two kinds of timers. One is "Common Timer"; the other is "Fast Timer". OpenCPU system allows max 10 Common Timers running at the same time in a task. The system provides only one Fast Timer for application. The accuracy of the Fast Timer is relatively higher than a common timer.

5.3.1. Usage

Developer uses `Ql_Timer_Register()` to create a common timer, and register the interrupt handler. And a timer id, which is an unsigned integer, must be specified. `Ql_Timer_Start()` can start the created timer, and `Ql_Timer_Stop()` can stop the running timer.

Developer may call `Ql_Timer_RegisterFast()` to create the Fast Timer, and register the interrupt handler. `Ql_Timer_Start()` can start the created timer, and `Ql_Timer_Stop()` can stop the running timer. The minimum interval for Fast Timer should be integral multiple of 10ms.

5.3.2. API Functions

5.3.2.1. Ql_Timer_Register

Register a Common Timer, each task supports 10 timers running at the same time. Only the task which registers the timer can start and stop the timer.

- **Prototype**

```
s32 Ql_Timer_Register(u32 timerId, Callback_Timer_OnTimer callback_onTimer, void* param)
typedef void(*Callback_Timer_OnTimer)(u32 timerId, void* param)
```

- **Parameter**

timerId:

[in] Timer ID. Must ensure that the ID is the only one under openCPU task. Of course, the ID that registered by “`Ql_Timer_RegisterFast`” also cannot be the same with it.

callback_onTimer:

[Out] Notify the customer when the timer arrives.

param:

[in] One customized parameter that can be passed into the callback functions.

- **Return Value**

QL_RET_OK: indicates register ok;

QL_RET_ERR_PARAM: indicates the param error.

QL_RET_ERR_INVALID_TIMER: indicates the timer invalid.

QL_RET_ERR_TIMER_FULL: indicates all timers are used up.

5.3.2.2. QI_Timer_RegisterFast

Register a Fast Timer, only support one timer for App. Please do not add any task schedule in the interrupt handler of the Fast Timer.

- **Prototype**

```
s32 QI_Timer_RegisterFast(u32 timerId, Callback_Timer_OnTimer callback_onTimer, void* param)
typedef void(*Callback_Timer_OnTimer)(u32 timerId, void* param)
```

- **Parameter**

timerId:

[in] Timer ID. Must ensure that the ID is not the same with the ID that registered by “QI_Timer_Register”.

callback_onTimer:

[Out] Notify the customer when the timer arrives.

param:

[in] One customized parameter that can be passed into the callback functions.

- **Return Value**

QL_RET_OK: indicates register ok;

QL_RET_ERR_PARAM: indicates the param error.

QL_RET_ERR_INVALID_TIMER: indicates the timer invalid.

QL_RET_ERR_TIMER_FULL: indicates all timers are used up.

5.3.2.3. QI_Timer_Start

Start up the specified timer. When start or stop a specified timer in a task, the task must be the same as registers the timer.

- **Prototype**

```
s32 QI_Timer_Start(u32 timerId, u32 interval, bool autoRepeat)
```

- **Parameter**

timerId:

[in] Timer ID. The timer ID must be registred.

interval:

[in] Set the interval of the timer, unit: ms.

If you start a Common Timer, the interval must be greater than or equal to 1ms. If you start a Fast Timer, the interval must be an integer multiple of 10ms.

autoRepeat:

[in] TRUE or FALSE, indicates that the timer is executed once or repeatedly.

- **Return Value**

QL_RET_OK: indicates start ok;

QL_RET_ERR_PARAM: indicates the param error.

QL_RET_ERR_INVALID_TIMER: indicates the timer invalid.

QL_RET_ERR_INVALID_TASK_ID: indicates the current task is not the timer registered task.

5.3.2.4. QI_Timer_Stop

Stop the specified timer. When start or stop a specified timer in a task, the task must be the same as registers the timer.

- **Prototype**

```
s32 QI_Timer_Stop(u32 timerId)
```

- **Parameter**

timerId:

[in] The timer ID. The timer has been started by calling QI_Timer_Start previously.

- **Return Value**

QL_RET_OK: indicates stop ok;

QL_RET_ERR_PARAM: indicates the param error.

QL_RET_ERR_INVALID_TIMER: indicates the timer invalid.

QL_RET_ERR_INVALID_TASK_ID: indicates the current task is not the timer registered task.

5.3.3. Example

The following code shows how to register a Common Timer and how to start a Common Timer.

```
s32 ret;  
u32 timerId=999; //Timer ID is 999  
u32 interval=2 * 1000; //2 seconds  
bool autoRepeat=TRUE;  
u32 param=555;
```

```
//Callback function
void Callback_Timer(u32 timerId, void* param)
{
    ret=QI_Timer_Stop(timerId);
    QI_Debug_Trace("\r\n<--Stop: timerId=%d,ret = %d -->\r\n", timerId ,ret);
}

//Register timer
ret=QI_Timer_Register(timerId, Callback_Timer, &param);
QI_Debug_Trace("\r\n<--Register: timerId=%d, param=%d,ret=%d -->\r\n", timerId ,param,ret);

//Start timer
ret=QI_Timer_Start(timerId, interval, autoRepeat);
QI_Debug_Trace("\r\n<--Start: timerId=%d,repeat=%d,ret=%d -->\r\n", timerId , autoRepeat,ret);
```

5.4. Power Management API

Power management contains the power-related operations, such power down, power key control and low power consumption enable/disable.

5.4.1. Usage

5.4.1.1. Power on/off

Developer may call QI_PowerDown function to power off the module when PWRKEY pin has not been shortcut to ground. And this action will become reset the module when PWRKEY pin has been shortcut to ground.

5.4.1.2. Sleep Mode

The QI_SleepEnable function can enable the sleep mode of module. And the module enters into sleep mode when it is idle.

The timeout of timer, coming call, coming SMS, GPRS data and an interrupt event can wake up the module from sleep mode. The QI_SleepDisable function can disable the sleep mode when module is woken up.

5.4.2. API Functions

5.4.2.1. QI_PowerDown

This function powers off the module. When call this API to power down the module, the module will complete the network anti-registration first. So power off the module will need more time.

- **Prototype**

```
void QI_PowerDown(u8 pwrDwnType)
```

- **Parameters**

pwrDwnType:

[in] Action types of this function.

1=Normal power off

- **Return Value**

None.

5.4.2.2. QI_LockPower

When getting the control right of power key, Application must call QI_LockPower to lock power supply, or module will lose power when the level of PWRKEY pin goes high. Please also see [\[4.4.1\]](#).

- **Prototype**

```
void QI_LockPower(void);
```

- **Parameters**

None.

- **Return Value**

None.

5.4.2.3. QI_PwrKey_Register

This function registers the callback for PWRKEY indication. The callback function will be triggered when the power KEY pressed down or released (including power on and power off). The configuration for power

key in sys_config.c should be set to FALSE. Or, the callback will not be triggered. Please see [\[4.4.1\]](#).

- **Prototype**

```
s32 QI_PwrKey_Register(Callback_PowerKey_Ind callback_pwrKey)
typedef void (*Callback_PowerKey_Ind)(s32 param1, s32 param2)
```

- **Parameters**

Callback_pwrKey:

[in] Callback function for PWRKEY indication.

param1:

[Out] One value of Enum_PowerKeyOpType.

param2:

[Out] One value of Enum_KeyState.

- **Return Value**

The return value is QL_RET_OK if this function succeeds. Otherwise, the return value is an error code. To get extended error information, please see ERROR CODES.

5.4.2.4. QI_SleepEnable

This function enables the sleep mode of module. The module will enter sleep mode when it's under idle state.

- **Prototype**

```
s32 QI_SleepEnable()
```

- **Parameters**

None.

- **Return Value**

QL_RET_OK: indicates this function success.

QI_RET_NOT_SUPPORT: function not supported in currently used version.

5.4.2.5. QI_SleepDisable

This function disables the sleep mode of module.

- **Prototype**

```
s32 QI_SleepDisable()
```

- **Parameters**

None.

- **Return Value**

QL_RET_OK: indicates this function success.

QL_RET_NOT_SUPPORT: this function is not supported.

5.4.3. Example

The following sample codes show how to enter and quit sleep module in the interrupt handler.

```
void Eint_Callback_Hdlr (Enum_PinName eintPinName, Enum_PinLevel pinLevel, void* customParam)
{
    If (0==pinLevel)
    {
        SYS_DEBUG( DBG_Buffer,"DTR set to low=%d  wake !!\r\n", level);
        QI_SleepDisable(); //Enter sleep
    }else{
        SYS_DEBUG( DBG_Buffer,"DTR set to high=%d  Sleep \r\n", level);
        QI_SleepEnable(); //Quit sleep
    }
}
```

5.5. Memory API

OpenCPU O.S supports dynamic memory management. QI_MEM_Alloc and QL_MEM_Free functions are used to allocate and release the dynamic memory.

The dynamic memory is system heap space. And the system heap of application can be customized by developer. Please see [\[4.1\]](#).

QI_MEM_Alloc and QL_MEM_Free must be present in pairs. Or memory leakage arises.

5.5.1. Usage

Step 1: Call `QI_MEM_Alloc()` to apply for a block of memory with the specified size. The memory allocate by `QI_MEM_Alloc()` is from system heap.

Step 2: If the memory block is not needed any more, please call `QI_MEM_Free()` to free the memoryblock that is previously allocated by calling `QI_MEM_Alloc()`.

5.5.2. API Functions

5.5.2.1. QI_MEM_Alloc

This function allocates memory with the specified size in the memory heap.

- **Prototype**

```
void *QI_MEM_Alloc (u32 size)
```

- **Parameter**

Size:

[in] Number of bytes of memory to be allocated.

- **Return Value**

A pointer of void type to the the address of allocated memory. NULL will be returned if the allocation fails.

5.5.2.2. QI_MEM_Free

This function frees the memory which is allocated by `QI_MEM_Alloc`.

- **Prototype**

```
void QI_MEM_Free (void *ptr);
```

- **Parameters**

Ptr:

[in] Previously allocated memory block to be free.

- **Return Value**

None.

5.5.3. Example

The following codes show how to allocate and free a specified size memory.

```
char *pch=NULL;

//Allocate memory
pch=(char*)QI_MEM_Alloc(1024);
if (pch !=NULL)
{
    QI_Debug_Trace("Successfully apply for memory, pch=0x%x\r\n", pch);
}else{
    QI_Debug_Trace("Fail to apply for memory, size=%d\r\n", 1024);
}
//Free memory
QI_MEM_Free(pch);
pch=NULL;
```

5.6. File System API

OpenCPU supports user file system, and provides a set of complete API functions to create, access and delete files and directories. This section describes these APIs and the usage.

The storage can be flash (UFS), SD card and RAM (RAM file). The RAM file don't support directory.

5.6.1. Usage

The type of storage is divided into three kinds, one is the UFS in the flash, the other is the SD card, and the last is RAM file system. The RAM file don't support directory. The customers can select the storage location according to their own needs. When you want to create/open a file or directory, you must use a relative path. For example, if you want to create a file in the root of the UFS, you can set as this, such as "filename.ext". If you want to create a file in the root of the SD card, you need to add the drive "SD:", such as "SD:filename.ext".

- The "QI_FS_GetTotalSpace" function is used to obtain the amount of total space on Flash or SD card.
- The "QI_FS_GetFreeSpace" function is used to obtain the amount of free space on Flash or SD card.
- The "QI_FS_GetSize" function is used to get the size, in bytes, of the specified file.
- The "QI_FS_Open" function is used to create or open a file, you must define the file's opening and

access mode. If you want to know its usage, please see the detailed descriptions of this function.

- The “`QI_FS_Read`” and “`QI_FS_Write`” functions are used to read or write a file, you must ensure that the file has been opened.
- The “`QI_FS_Seek`” and “`QI_FS_GetFilePosition`” functions are used to set or get the position of the file pointer, you must ensure that the file has been opened.
- The “`QI_FS_Truncate`” function is used to truncate the specified file to zero length.
- The “`QI_FS_Delete`” and “`QI_FS_Check`” functions are used to delete or check a file.
- The “`QI_FS_CreateDir`”, “`QI_FS_DeleteDir`” and “`QI_FS_CheckDir`” functions are used to create, delete or check a specified directory.
- The “`QI_FS_FindFirst`”, “`QI_FS_FindNext`” and “`QI_FS_XDelete`” functions are used to traverse all files and directories in the specified directory. These three functions are usually used together.
- The “`QI_FS_XDelete`” function is multi-functional; it can be used to delete a specified file or an empty directory. You can also delete all files and directories in the specified directory by recursive way.
- The “`QI_FS_XMove`” function is used to move or copy a file or folder.
- The “`QI_FS_Format`” function is used to format the SD card or UFS.

NOTES

1. The RAM file does not support directory.
2. This stack size of the task, in which file operations will be executed, cannot be less than 5KB.

5.6.2. API Functions

5.6.2.1. `QI_FS_Open`

This function opens or creates a file with a specified name.

- **Prototype**

```
s32 QI_FS_Open(char* lpFileName, u32 flag)
```

- **Parameters**

lpFileName:

[in] The name of the file. The name is limited to 252 characters. You must use a relative path, such as “*filename.ext*” or “*dirname\filename.ext*”.

flag:

[in] A u32 that defines the file's opening and access mode. The possible values are shown as follow:

- `QL_FS_READ_WRITE`: can read and write.
- `QL_FS_READ_ONLY`: can only read.

- **QL_FS_CREATE**: opens the file, if it exists. If the file does not exist, the function creates the file.
- **QL_FS_CREATE_ALWAYS**: creates a new file. If the file exists, the function overwrites the file and clears the existing attributes.

- **Return Value**

If the function succeeds, the return value specifies a file handle. If the function fails, the return value is an error codes.

- **QL_RET_ERR_FILE_NO_CARD**: indicates no SD card.
- **QL_RET_ERR_PARAM**: indicates parameter error.
- **QL_RET_ERR_FILENAME_TOO_LONG**: indicates filename too length.
- **QL_RET_ERR_FILE_OPEN_FAILED**: indicates open file failed.

5.6.2.2. QI_FS_OpenRAMFile

This function opens or creates a file with a specified name in the RAM, you need to add prefix "RAM:" in the front of the file. You can create 15 files at most.

- **Prototype**

```
s32 QI_FS_OpenRAMFile(char *lpFileName, u32 flag, u32 ramFileSize)
```

- **Parameters**

lpFileName:

[in] The file name. The name is limited to 252 characters. You must use a relative path, such as "RAM: filename.ext".

flag:

[in] A u32 that defines the file's opening and access mode. The possible values are shown as follow:

- **QL_FS_READ_WRITE**: can read and write.
- **QL_FS_READ_ONLY**: can only read.
- **QL_FS_CREATE**: opens the file, if it exists. If the file does not exist, the function creates the file.
- **QL_FS_CREATE_ALWAYS**: creates a new file. If the file exists, the function overwrites the file and clears the existing attributes.

ramFileSize:

[in] The size of the specified file which you want to create.

- **Return Value**

If the function succeeds, the return value specifies a file handle. If the function fails, the return value is an

error codes.

- QL_RET_ERR_FILE_NO_CARD: indicates no SD card.
- QL_RET_ERR_PARAM: indicates parameter error.
- QL_RET_ERR_FILENAME_TOOLENGTH: indicates filename too length.
- QL_RET_ERR_FILEOPENFAILED: indicates open file failed.

5.6.2.3. QI_FS_Read

Read data from the specified file, starting at the position indicated by the file pointer. After the read operation has been completed, the file pointer is adjusted by the number of bytes actually read.

- **Prototype**

```
s32 QI_FS_Read(s32 fileHandle, u8 *readBuffer, u32 numberOfBytesToRead, u32  
*numberOfBytesRead)
```

- **Parameters**

fileHandle:

[in] A handle to the file to be read, which is the return value of the function “QI_FS_Open”.

readBuffer:

[Out] Point to the buffer that receives the data read from the file.

numberOfBytesToRead:

[in] Number of bytes to be read.

numberOfBytesRead:

[Out] The number of bytes has been read. Sets this value to zero before doing taking action or checking errors

- **Return Value**

QL_RET_OK: success.

QL_RET_ERR_FILEREADFAILED: read file failed.

5.6.2.4. QI_FS_Write

This function writes data from a buffer to the specified file, and returns the real written number of bytes.

- **Prototype**

```
s32 QI_FS_Write(s32 fileHandle, u8 *writeBuffer, u32 numberOfBytesToWrite, u32 *numberOfBytesWritten)
```

- **Parameters**

fileHandle:

[in] A handle to the file to be written, which is the return value of the function “*QI_FS_Open*”.

writeBuffer:

[in] Point to the buffer containing the data to be written to the file.

numberOfBytesToWrite:

[in] Number of bytes to write to the file.

numberOfBytesWritten:

[Out] Point to the number of bytes written by the function call.

- **Return Value**

QL_RET_OK: success.

QL_RET_ERR_FILEDISKFULL: file disk is full.

QL_RET_ERR_FILEWRITEFAILED: write file failed.

5.6.2.5. QI_FS_Seek

This function repositions the pointer in the previously open file.

- **Prototype**

```
s32 QI_FS_Seek(s32 fileHandle, s32 offset, u32 whence)
```

- **Parameters**

fileHandle:

[in] File handle, which is the return value of the function *QI_FS_Open*.

offset:

[in] Number of bytes to move the file pointer.

whence:

[in] Pointer movement mode. Must be one of the following values.

```
typedef enum
{
    QL_FS_FILE_BEGIN,
    QL_FS_FILE_CURRENT,
    QL_FS_FILE_END
} Enum_FsSeekPos;
```

- **Return Value**

QL_RET_OK: success.

QL_RET_ERR_FILESEEKFAILED: file seek failed.

5.6.2.6. QL_FS_GetFilePosition

This function gets the current value of the file pointer.

- **Prototype**

```
s32 QL_FS_GetFilePosition(s32 fileHandle)
```

- **Parameters**

fileHandle:

[in] File handle, which is the return value of the function *QL_FS_Open*.

- **Return Value**

The return value is the current offset from the beginning of the file if this function succeeds. Otherwise, the return value is an error code. QL_RET_ERR_FILEFAILED, fail to operate file.

5.6.2.7. QL_FS_Truncate

This function truncates the specified file to zero length.

- **Prototype**

```
s32 QL_FS_Truncate(s32 fileHandle)
```

- **Parameters**

fileHandle:

[in] The file handle, it is the return value of the function "*QL_FS_Open*".

- **Return Value**

QL_RET_OK: success.

QL_RET_ERR_FILEFAILED: fail to operate file.

5.6.2.8. QI_FS_Flush

Force any data remaining in the file buffer to be written to the file.

- **Prototype**

```
void QI_FS_Flush(s32 fileHandle)
```

- **Parameters**

fileHandle:

[in] The file handle, which is the return value of the function *QI_FS_Open*.

- **Return Value**

None.

5.6.2.9. QI_FS_Close

Closes the file associated with the file handle and makes the file unavailable for reading or writing.

- **Prototype**

```
void QI_FS_Close(s32 fileHandle)
```

- **Parameters**

fileHandle:

[in] The file handle, which is the return value of the function *QI_FS_Open*.

- **Return Value**

None.

5.6.2.10. QI_FS_GetSize

This function retrieves the size, in bytes, of the specified file.

- **Prototype**

```
s32 QI_FS_Delete(char *lpFileName)
```

- **Parameters**

lpFileName:

[in] The name of the file. The name is limited to 252 characters. You must use a relative path, such as "filename.ext" or "dirname\filename.ext".

- **Return Value**

The return value is the bytes of the file if this function succeeds. Otherwise, the return value is an error code.

QL_RET_ERR_FILE_NO_CARD: no SD card.

QL_RET_ERR_PARAM: parameter error.

QL_RET_ERR_FILENAME_TOO_LONG: filename too long.

QL_RET_ERR_FILE_FAILED: fail to operate file.

5.6.2.11. QI_FS_Delete

This function deletes an existing file.

- **Prototype**

```
s32 QI_FS_Delete(char *lpFileName)
```

- **Parameters**

lpFileName:

[in] The name of the file. The name is limited to 252 characters. You must use a relative path, such as "filename.ext" or "dirname\filename.ext".

- **Return Value**

QL_RET_OK: success.

QL_RET_ERR_FILE_NO_CARD: no SD card.

QL_RET_ERR_PARAM: parameter error.

QL_RET_ERR_FILENAME_TOO_LONG: filename too long.

QL_RET_ERR_FILE_FAILED: fail to operate file.

5.6.2.12. QI_FS_Check

This function checks whether the file exists or not.

- **Prototype**

```
s32 QI_FS_Check(char *lpFileName)
```

- **Parameters**

lpFileName:

[in] The file name. The name is limited to 252 characters. You must use a relative path, such as "filename.ext" or "dirname\filename.ext".

- **Return Value**

QL_RET_OK: success.

QL_RET_ERR_FILE_NO_CARD: no SD card.

QL_RET_ERR_PARAM: parameter error.

QL_RET_ERR_FILENAME_TOO_LONG: filename too long.

QL_RET_ERR_FILE_FAILED: fail to operate file.

QL_RET_ERR_FILE_NOT_FOUND: file not found.

5.6.2.13. QI_FS_Rename

This function renames an existing file.

- **Prototype**

```
s32 QI_FS_Rename(char *lpFileName, char *newLpFileName)
```

- **Parameters**

lpFileName:

[in] The current name of the file. The name is limited to 252 characters. You must use a relative path, such as "filename.ext" or "dirname\filename.ext".

newLpFileName:

[in] The new name of the file. The new name is different from the existing names. The name is limited to

252 characters. You must use a relative path, such as "filename.ext", "dirname\filename.ext".

- **Return Value**

QL_RET_OK: success.

QL_RET_ERR_FILE_NO_CARD: no SD card.

QL_RET_ERR_PARAM: parameter error.

QL_RET_ERR_FILENAME_TOO_LONG: filename too long.

QL_RET_ERR_FILE_FAILED: fail to operate file.

5.6.2.14. QI_FS_CreateDir

This function creates a directory.

- **Prototype**

```
s32 QI_FS_CreateDir(char *lpDirName)
```

- **Parameters**

lpDirName:

[in] The name of the directory. The name is limited to 252 characters. You must use a relative path, such as "dirname1" or "dirname1\dirname2".

- **Return Value**

QL_RET_OK: success.

QL_RET_ERR_FILE_NO_CARD: no SD card.

QL_RET_ERR_PARAM: parameter error.

QL_RET_ERR_FILENAME_TOO_LONG: filename too long.

QL_RET_ERR_FILE_FAILED: fail to operate file.

5.6.2.15. QI_FS_DeleteDir

This function deletes an existing directory.

- **Prototype**

```
s32 QI_FS_DeleteDir(char *lpDirName)
```

- **Parameters**

lpDirName:

[in] The name of the directory. The name is limited to 252 characters. You must use a relative path, such as "dirname1" or "dirname1\dirname2".

- **Return Value**

QL_RET_OK: success.

QL_RET_ERR_FILE_NO_CARD: no SD card.

QL_RET_ERR_PARAM: parameter error.

QL_RET_ERR_FILENAME_TOO_LONG: filename too long.

QL_RET_ERR_FILE_FAILED: fail to operate file.

5.6.2.16. QI_FS_CheckDir

This function checks whether the directory exists or not.

- **Prototype**

```
s32 QI_FS_CheckDir(char *lpDirName)
```

- **Parameters**

lpDirName:

[in] The name of the directory. The name is limited to 252 characters. You must use a relative path, such as "dirname1" or "dirname1\dirname2".

- **Return Value**

QL_RET_OK: success.

QL_RET_ERR_FILE_NO_CARD: no SD card.

QL_RET_ERR_PARAM: parameter error.

QL_RET_ERR_FILENAME_TOO_LONG: filename too long.

QL_RET_ERR_FILE_FAILED: fail to operate file.

QL_RET_ERR_FILE_NOT_FOUND: file not found.

5.6.2.17. QI_FS_FindFirst

Search a directory for a file or subdirectory which name matches the specified file name.

- **Prototype**

```
s32 QI_FS_FindFirst(char *lpPath, char *lpFileName, u32 fileNameLength, u32 *fileSize, bool *isDir)
```

- **Parameters**

lpPath:

[in] Pointer to a null-terminated string that specifies a valid directory or path.

lpFileName:

[in] Pointer to a null-terminated string that specifies a valid file name, which can contain wildcard characters, such as * and?.

fileNameLength:

[in] The maximum number of bytes to be received of the name.

fileSize:

[Out] A pointer to the variable which represents the size specified by the file.

isDir:

[Out] A pointer to the variable which represents the type specified by the file.

- **Return Value**

If the function succeeds, the return value is a search handle that can be used in a subsequent call to the “*QI_FindNextFile*” or “*QI_FindClose*” function.

If the function fails, the return value is an error codes:

QL_RET_ERR_FILE_NO_CARD: no SD card.

QL_RET_ERR_PARAM: parameter error.

QL_RET_ERR_FILENAME_TOO_LONG: filename too long.

QL_RET_ERR_FILE_FAILED: fail to operate file.

QL_RET_ERR_FILE_NO_MORE: no more file.

5.6.2.18. QI_FS_FindNext

This function continues a file to search from a previous call to the “*QI_FS_FindFirst*” function.

- **Prototype**

```
s32 QI_FS_FindNext(s32 handle, char *lpFileName, u32 fileNameLength, u32 *fileSize, bool *isDir)
```

- **Parameters**

handle:

[in] The search handle returned by a previous call to the “*QI_FS_FindFirst*” function.

lpFileName:

[in] Pointer to a null-terminated string that specifies a valid file name, which can contain wildcard characters, such as * and?.

fileNameLength:

[in] The maximum number of bytes to be received of the name.

fileSize:

[Out] A pointer to the variable which represents the size specified by the file.

isDir:

[Out] A pointer to the variable whose type is specified by the file.

- **Return Value**

QL_RET_OK: success.

QL_RET_ERR_PARAM: parameter error.

QL_RET_ERR_FILEFAILED: fail to operate file.

QL_RET_ERR_FILENOMORE: file not found.

5.6.2.19. QI_FS_FindClose

This function closes the specified search handle.

- **Prototype**

```
void QI_FS_FindClose(s32 handle)
```

- **Parameters**

handle:

[in] Find handle, returned by a previous call of the “*QI_FS_FindFirst*” function.

- **Return Value**

None.

5.6.2.20. QI_FS_XDelete

This function deletes a file or directory.

- **Prototype**

```
s32 QI_FS_XDelete(char* lpPath, u32 flag)
```

- **Parameters**

lpPath:

[in] File path to be deleted.

flag:

[in] A u32 that defines the file's opening and access mode.

The possible values are shown as follow:

QL_FS_FILE_TYPE

QL_FS_DIR_TYPE

QL_FS_RECURSIVE_TYPE

- **Return Value**

QL_RET_OK: success.

QL_RET_ERR_PARAM: parameter error.

QL_RET_ERR_FILENAME_TOO_LONG: filename too length.

QL_RET_ERR_FILE_NOT_FOUND: file not found.

QL_RET_ERR_PATH_NOT_FOUND: path not found.

QL_RET_ERR_GET_MEM: fail to get memory.

QL_RET_ERR_GENERAL_FAILURE: general failure.

5.6.2.21. QI_FS_XMove

This function provides a facility to move or copy a file or folder

- **Prototype**

```
s32 QI_FS_XMove(char* lpSrcPath, char* lpDestPath, u32 flag)
```

- **Parameters**

lpSrcPath:

[in] Source path to be moved or copied.

lpDestPath:

[in] Destination path.

flag:

[in] A u32 that defines the file's opening and access mode.

The possible values are shown as follow:

QL_FS_MOVE_COPY

QL_FS_MOVE_KILL

QL_FS_MOVE_OVERWRITE

- **Return Value**

QL_RET_OK: success.

QL_RET_ERR_PARAM: parameter error.

QL_RET_ERR_FILENAME_TOO_LONG: filename too length.

QL_RET_ERR_FILE_NOT_FOUND: file not found.

QL_RET_ERR_PATH_NOT_FOUND: path not found.

QL_RET_ERR_GET_MEM: fail to get memory.

QL_RET_ERR_FILE_EXISTS: file existed.

QL_RET_ERR_GENERAL_FAILURE: general failure.

5.6.2.22. QI_FS_GetFreeSpace

This function obtains the amount of free space on Flash or SD card.

- **Prototype**

```
s64 QI_FS_GetFreeSpace (u32 storage)
```

- **Parameters**

storage:

[in] The type of storage, which is one value of “*Enum_FSSStorage*”.

```
typedef enum
{
    QI_FS_UFS = 1,
    QI_FS_SD = 2,
    QI_FS_RAM = 3,
}Enum_FSSStorage;
```

- **Return Value**

The return value is the total number of bytes of the free space in the specified storage, if this function succeeds. Otherwise, the return value is an error code.

QI_RET_ERR_UNKOWN: unkown error.

5.6.2.23. QI_FS_GetTotalSpace

This function obtains the amount of total space on Flash or SD card.

- **Prototype**

```
s64 QI_FS_GetTotalSpace(u32 storage)
```

- **Parameters**

storage:

[in] The type of storage, which is one value of “*Enum_FSSStorage*”.

- **Return Value**

The return value is the total number of bytes in the specified storage if this function succeeds. Otherwise, the return value is an error code.

QI_RET_ERR_UNKOWN: unkown error.

5.6.2.24. QI_FS_Format

This function format the SD card or UFS.

- **Prototype**

```
s32 QI_FS_Format(u32 storage)
```

- **Parameters**

storage:

[in] The format storage, which is one value of “*Enum_FSSStorage*”.

- **Return Value**

QL_RET_OK: success.

QL_RET_ERR_PARAM: parameter error.

QL_RET_ERR_FILENAME_TOO_LONG: filename too length.

QL_RET_ERR_FILE_NOT_FOUND: file not found.

QL_RET_ERR_PATH_NOT_FOUND: path not found.

QL_RET_ERR_GET_MEM: fail to get memory.

QL_RET_ERR_GENERAL_FAILURE: general failure.

5.6.3. Example

The following codes show how to use the file system functions.

```
#define MEMORY_TYPE      1
#define FILE_NAME        "test.txt"
#define NEW_FILE_NAME    "file.txt"
#define DIR_NAME          "DIR\\"
#define LPPATH            "\\*"
#define LPPATH2           "\\DIR\\"
#define XDELETE_PATH      "\\\"
#define WRITE_DATA        "1234567890"
#define OFFSET            0

void API_TEST_File(void)
{
    s32 ret;
    s64 size;
    s32 filehandle, findfile;
    u32 writeedlen, readedlen ;
    u8 strBuf[100];
    s32 position;
    s32 filesize;
    bool isdir;

    //Get amount of free space on Flash
    size=QL_FS_GetFreeSpace(MEMORY_TYPE);
    QL_Debug_Trace("QL_FS_GetFreeSpace()=%lld,type =%d\r\n",size,MEMORY_TYPE);

    //Get the amount of total space on Flash
    size=QL_FS_GetTotalSpace(MEMORY_TYPE);
    QL_Debug_Trace("QL_FS_GetTotalSpace()=%lld,type =%d\r\n",size,MEMORY_TYPE);

}
```

5.7. Hardware Interface API

5.7.1. UART

5.7.1.1. UART Overview

In OpenCPU, UART ports include physical UART ports and virtual UART ports. The physical UART ports can be applied to connect to external devices, and the virtual UART ports are used to communicate between application and the bottom operating system.

One of physical UART ports has hardware handshaking function. And others are three-wire interfaces.

OpenCPU provides two virtual UART ports that are used for communication between App and Core. These virtual ports are designed according to the features of physical serial interface. And virtual port has its RI, DCD information. The level of DCD can be used to indicate this virtual port is in data mode or AT command mode.

The working chart for UARTs is shown below:

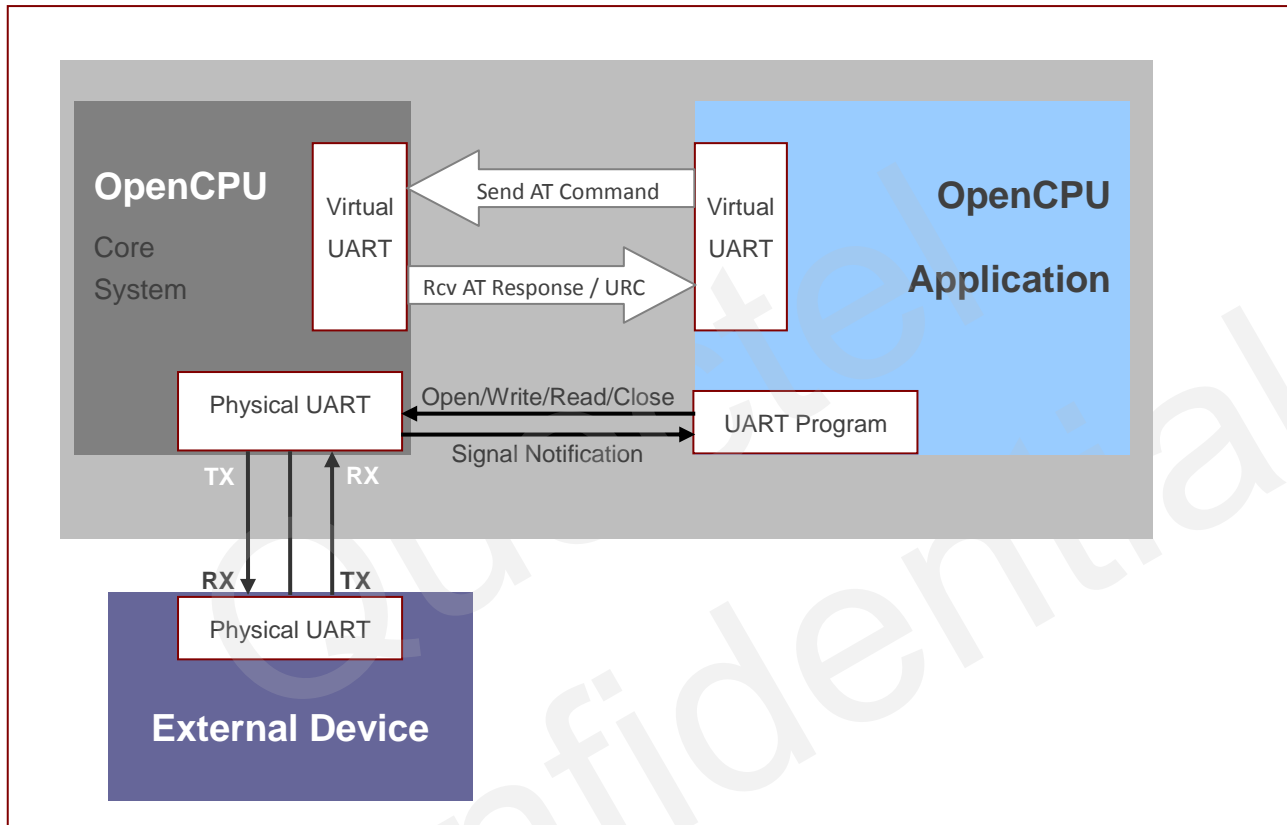

Figure 3: The Working Chart of UART

5.7.1.2. UART Usage

For physical UART or virtual UART initialization and usage, you can accomplish by following a few simple steps.

- Step 1:** Call `QI_UART_Register` to register the UART's callback function.
- Step 2:** Call `QI_UART_Open` to open the special UART port.
- Step 3:** Call `QI_UART_Write` to write data to the specified UART port. When the number of bytes actually sent is less than that to send, Application should stop sending data, and application will receive an event `EVENT_UART_READY_TO_WRITE` later in callback function. After receiving this event application can continue to send data, and previously unsent data should be resent.

Step 4: In the callback function, deal with the UART's notification. If the notification type is `EVENT_UART_READY_TO_READ`, developer should read out all data in the UART RX buffer; otherwise, there will not be such notification to be reported to application when new data comes to UART RX buffer later.

5.7.1.3. API Functions

5.7.1.3.1. QI_UART_Register

This function registers the callback function for the specified serial port. UART callback function is used to receive the UART notification from core system.

- **Prototype**

```
s32 QI_UART_Register(Enum_SerialPort port, CallBack_UART_Notify callback_uart,void *  
customizePara)  
typedef void (*CallBack_UART_Notify)( Enum_SerialPort port, Enum_UARTEventType event, bool  
pinLevel,void *customizePara)
```

- **Parameters**

port:

[in] Port name.

callback_uart:

[in] The pointer of the UART callback function.

event:

[out] Indication the event type of uart call back, one value of Enum_UARTEventType.

pinLevel:

[out] If the event type is `EVENT_UART_RI_IND` or `EVENT_UART_DCD_IND` or `EVENT_UART_DTR_IND` the pinLevel indication the relate pin's current level otherwise this parameter has no meaning, just ignore it.

customizePara:

[in] Customized parameter, if not use just set to NULL.

- **Return Value**

The return value is `QL_RET_OK` if this function succeeds. Otherwise, the return value is an error code. To get extended error information, please see ERROR CODES.

5.7.1.3.2. QI_UART_Open

This function opens a specified UART port with the specified flow control mode. Which task calls this function, which task will own the specified UART port.

- **Prototype**

```
s32 QI_UART_Open(Enum_SerialPort port,u32 baudrate, Enum_FlowCtrl flowCtrl)
```

```
typedef enum {  
    FC_NONE=1, // None Flow Control  
    FC_HW,     // Hardware Flow Control  
    FC_SW      // Software Flow Control  
} Enum_FlowCtrl;
```

- **Parameters**

port:

[in] Port name.

baudrate:

[in] The baud rate of the UART to be open.

The physical UART's baud rate supports 75, 150, 300, 600, 1200, 2400, 4800, 7200, 9600, 14400, 19200, 28800, 38400, 57600, 115200, 230400, 460800. The parameter does not take effect on the VIRTUAL_PORT1 and VIRTUAL_PORT2, just set to 0

flowCtrl:

[in] Please refer to Enum_flowCtrl, for the physical UART ports. Only UART_PORT1 supports hardware flow control (FC_HW).

- **Return Value**

The return value is QL_RET_OK if this function succeeds. Otherwise, the return value is an error code. To get extended error information, please see ERROR CODES.

5.7.1.3.3. QI_UART_OpenEx

This function opens a specified UART port with the specified DCB parameters. Which task calls this function, which task will own the specified UART port.

- **Prototype**

```
s32 QI_UART_OpenEx(Enum_SerialPort port, ST_UARTDCB *dcb)
```

- **Parameters**

port:

[in] Port name.

dcb:

[in] Pointer to the UART DCB setting, including baud rate, data bits, stop bits, parity, and flow control. Only physical serial port1 (UART_PORT1) supports hardware flow control. And this parameter doesn't take effect on the VIRTUAL_PORT1 and VIRTUAL_PORT2, just set to NULL.

- **Return Value**

The return value is QL_RET_OK if this function succeeds. Otherwise, the return value is an error code. To get extended error information, please see ERROR CODES.

5.7.1.3.4. **QI_UART_Write**

This function is used to send data to the specified UART port. When the number of bytes actually sent is less than that to send, application should stop sending data, and application (in callback function) will receive an event EVENT_UART_READY_TO_WRITE later. After receiving this event application can continue to send data, and previously unsent data should be resend.

- **Prototype**

```
s32 QI_UART_Write(Enum_SerialPort port, u8* data, u32 writeLen)
```

- **Parameters**

port:

[in] Port name

data:

[in] Pointer to data to write.

writeLen:

[in] The length of the data to write. For VIRTUAL_UART1 and VIRTUAL_UART2, the maximum length that can be written at one time is 1023 bytes which cannot be modified programmatically in application.

- **Return Value**

Number of bytes actually written. If this function fails to write data, a negative number will be returned. To get extended information, please see ERROR CODES .

5.7.1.3.5. QI_UART_Read

This function read data from the specified UART port. When the UART callback is invoked, and the notification is EVENT_UART_READY_TO_READ, developer should read out all data in the UART RX buffer by calling this function in loop; otherwise, there will not be such notification to be reported to application when new data comes to UART RX buffer later.

- **Prototype**

```
s32 QI_UART_Read(Enum_SerialPort port, u8* data, u32 readLen)
```

- **Parameters**

port:

[in] Port name

data:

[in] Point to buffer for the read data.

readLen:

[in] The length of the data to be read. The max data length of the receive buffer for physical UART buffer is 3584 bytes, 1023 bytes for virtual UART. And the buffer size cannot be modified programmatically in application.

- **Return Value**

Number of bytes actually read. If 'readLen' equal with the actual read len, user need continue read the UART until the actual read len is less than the 'readLen'. To get extended information please see ERROR CODES.

5.7.1.3.6. QI_UART_SetDCBConfig

This function sets the parameters of the specified UART port. This function works only for physical UART ports.

- **Prototype**

```
s32 QI_UART_SetDCBConfig(Enum_SerialPort port, ST_UARTDCB *dcb)
```

The enumerations for DCB are defined below.

```
typedef enum {  
    DB_5BIT = 5,  
    DB_6BIT,
```

```

    DB_7BIT,
    DB_8BIT
} Enum_DataBits;

typedef enum {
    SB_ONE=1,
    SB_TWO,
    SB_ONE_DOT_FIVE
} Enum_StopBits;

typedef enum {
    PB_NONE=0,
    PB_ODD,
    PB_EVEN,
    PB_SPACE,
    PB_MARK
} Enum_ParityBits;

typedef enum {
    FC_NONE=1,    //None Flow Control
    FC_HW,        //Hardware Flow Control
    FC_SW         //Software Flow Control
} Enum_FlowCtrl;

typedef struct {
    u32             baudrate;
    Enum_DataBits   dataBits;
    Enum_StopBits   stopBits;
    Enum_ParityBits parity;
    Enum_FlowCtrl   flowCtrl;
}ST_UARTDCB;

```

● Parameter

port:

[in] Port name.

dcb:

[in] The pointer to the UART DCB struct. Include baud rate, databits, stopbits and parity.

● Return Value

The return value is *QL_RET_OK* if this function succeeds. Otherwise, the return value is an error code. To get extended error information, please see ERROR CODES.

5.7.1.3.7. QI_UART_GetDCBConfig

This function gets the configuration parameters of the specified UART port. This function works only for physical UART ports.

- **Prototype**

```
s32 QI_UART_GetDCBConfig(Enum_SerialPort port, ST_UARTDCB *dcb)
```

- **Parameter**

port:

[in] Port name.

dcb:

[in] The specified UART port's current DCB configuration parameter, include baud rate, databits, stopbits and parity.

- **Return Value**

The return value is *QL_RET_OK* if this function succeeds. Otherwise, the return value is an error code. To get extended error information, please see ERROR CODES.

5.7.1.3.8. QI_UART_ClrRxBuffer

This function clears the receive-buffer of the specified UART port.

- **Prototype**

```
void QI_UART_ClrRxBuffer(Enum_SerialPort port)
```

- **Parameter**

port:

[in] Port name.

- **Return Value**

None.

5.7.1.3.9. QI_UART_ClrTxBuffer

This function clears the send-buffer of the specified UART port.

- **Prototype**

```
void QI_UART_ClrTxBuffer(Enum_SerialPort port)
```

- **Parameter**

port:

[in] Port name.

- **Return Value**

None.

5.7.1.3.10. QI_UART_GetPinStatus

This function gets the pin status (include RI, DCD, DTR) of the virtual UART port. It does not work for the physical UART ports

- **Prototype**

```
s32 QI_UART_GetPinStatus(Enum_SerialPort port, Enum_UARTPinType pin)
```

```
typedef enum {  
UART_PIN_RI=0,           //RI read operator only valid on the virtual UART  
                           //RI set operator is invalid both on virtual and physical UART  
UART_PIN_DCD,           //DCD read operator only valid on the virtual UART  
                           //DCD set operator is invalid both on virtual and physical UART  
} Enum_UARTPinType;
```

- **Parameters**

port:

[in] Virtual UART port name.

pin:

[in] Pin name, one value of Enum_UARTPinType.

- **Return Value**

If ≥ 0 , indicates success, and the return special pin level value. 0: low level, 1: high level.

If ≤ -1 , indicates failure.

5.7.1.3.11. QI_UART_SetPinStatus

This function sets the pin level status of the virtual UART port. It doesn't work for the physical UART ports.

- **Prototype**

```
s32 QI_UART_SetPinStatus(Enum_SerialPort port, Enum_UARTPinType pin, bool pinLevel)
```

- **Parameters**

port:

[in] Virtual UART port name

pin:

[in] Pin name, one value of Enum_UARTPinType.

pinLevel:

[in] The pin level to be set. 0: low level, 1: high level.

- **Return Value**

The return value is QL_RET_OK if this function succeeds. Otherwise, the return value is an error code. To get extended error information, please see ERROR CODES.

5.7.1.3.12. QI_UART_SendEscap

This function notifies the virtual serial port to quit from Data Mode, and return back to Command Mode. And this function works only for virtual ports.

- **Prototype**

```
s32 QI_UART_SendEscap (Enum_SerialPort port)
```

- **Parameters**

port:

[in] Port name

- **Return Value**

The return value is QL_RET_OK if this function succeeds. Otherwise, the return value is an error code. To get extended error information, please see ERROR CODES.

5.7.1.3.13. QI_UART_Close

This function closes the specified UART port.

- **Prototype**

```
void QI_UART_Close(Enum_SerialPort port)
```

- **Parameter**

port:

[in] Port name.

- **Return Value**

None.

5.7.1.4. Example

This chapter gives the example of how to use the UART port.

```
//Write the call back function, for deal with the UART notifications.
static void CallBack_UART_Hdlr(Enum_SerialPort port, Enum_UARTEventType msg, bool level, void*
customizedPara); //Call back
{
    switch(msg)
    case EVENT_UART_READ_TO_READ:
        //Read data from the UART port
        QI_UART_Read (port,buffer,rlen);
        break;
    case EVENT_UART_READ_TO_WRITE:
        //Resume the operation of write data to UART
        QL_UART_Write(port,buffer,wlen);
        break;
    case EVENT _UART_RI_CHANGE:
        break;
    case EVENT _UART_DCD_CHANGE
        break;
    case EVENT _UART_DTR_CHANGE:
        break;
    case EVENT _UART_FE_IND:
        break;
    default:
        break;
```

```

}
//Register the call back function
s32 QI_UART_Register(UART_PORT1, CallBack_UART_Hdlr,NULL)
//Open the specified uart port
QI_UART_Open(UART_PORT1);
//Write data to uart port
QL_UART_Write(UART_PORT1,buffer,len)

```

5.7.2. GPIO

5.7.2.1. GPIO Overview

There're 23 I/O pins that can be designed for general purpose I/O. All pins can be accessed under OpenCPU by API functions.

5.7.2.2. GPIO List

Table 6: Multiplexing Pins

PIN No	PIN NAME	RESET	MODE1	MODE2	MODE3
3	PINNAME_GPIO0	I/PU	GPIO		
4	PINNAME_NETLIGHT ①	I/PD	NETLIGHT	GPIO	PWM_OUT
15	PINNAME_STATUS	I/PD	STATUS	GPIO	
18	PINNAME_PCM_IN	I/PD	PCM_IN	GPIO	
19	PINNAME_PCM_CLK	I/PD	PCM_CLK	GPIO	
20	PINNAME_PCM_OUT	I/PD	PCM_OUT	GPIO	
21	PINNAME_PCM_SYNC ②	I/PU	PCM_SYNC	GPIO	
24	PINNAME_GPIO1	I/PD	GPIO		
25	PINNAME_GPIO2	I/PD	GPIO		
26	PINNAME_GPIO3	I/PD	GPIO		
27	PINNAME_GPIO4	I/PD	GPIO		
28	PINNAME_GPIO5	I/PD	GPIO		
29	PINNAME_GPIO6	I/PU	GPIO		

PIN No	PIN NAME	RESET	MODE1	MODE2	MODE3
30	PINNAME_GPIO7	I/PU	GPIO		
31	PINNAME_GPIO8	I/PU	GPIO		
32	PINNAME_GPIO9	I/PU	GPIO		
33	PINNAME_GPIO10	I/PU	GPIO		
45	PINNAME_DCD	I/PD	DCD	GPIO	CLOCK
46	PINNAME_RI	I/PD	RI	GPIO	
47	PINNAME_DTR	I/PU	DTR	GPIO	EINT
48	PINNAME_CTS	I/PD	CTS	GPIO	
49	PINNAME_RTS	I/PU	RTS	GPIO	
57	PINNAME_SIM_PRESENCE	I/PU	SIM_PRES	GPIO	EINT

Table 7: Important Notes

Pin No.	Pin Name	Remark
4	PINNAME_NETLIGHT ①	Pull-down with 100K resistor within module. This pin cannot be pulled up during powering on.
21	PINNAME_PCM_SYNC ②	Pull-up with 100K resistor within module. This pin cannot be pulled down during powering on.

- The 'MODE1' defines the original status of pin in standard module.
- "RESET" column defines the default status of every pin after system powers on.
- "I" means input.
- "O" means output.
- "PU" means internal pull-up circuit.
- "PD" means internal pull-down circuit.
- "EINT" means external interrupt input.
- "CLOCK" means clock output function.

5.7.2.3. GPIO Initial Configuration

In OpenCPU, there're two ways to initialize GPIOs. One is to configure initial GPIO list in "custom_gpio_cfg.h", please refer to [4.3]; the other way is to call GPIO related API to initialize after App starts.

The following codes show the PINNAME_NETLIGHT, PINNAME_STATUS and PINNAME_GPIO0 pins initial Configuration in “*custom_gpio_cfg.h*” file.

```

/*-----
{ Pin Name      |      Direction      |      Level      |      Pull Selection      }
*-----*/
#if 1// If needed, config GPIOs here
GPIO_ITEM(PINNAME_NETLIGHT,      PINDIRECTION_OUT,      PINLEVEL_LOW,      PINPULLSEL_PULLDOWN)
GPIO_ITEM(PINNAME_STATUS,        PINDIRECTION_OUT,        PINLEVEL_LOW,        PINPULLSEL_PULLDOWN)
GPIO_ITEM(PINNAME_GPIO1,         PINDIRECTION_OUT,         PINLEVEL_LOW,         PINPULLSEL_PULLUP)
#else if
...
#endif

```

5.7.2.4. GPIO Usage

The following are how to use the multifunctional GPIOs:

- Step 1:** GPIO initialization. Call QI_GPIO_Init function sets the specified pin as the GPIO function, and initializes the configurations, including direction, level and pull selection.
- Step 2:** GPIO control. When the pin is initialized as GPIO. The developers can call the GPIO related APIs to change the GPIO level.
- Step 3:** Release the pin. If you don't want use this pin no longer, and need use this pin for other purpose (such as PWM, CLOCK, EINT). you must call QI_GPIO_Uninit to release the pin first. This step is optional.

5.7.2.5. API Functions

5.7.2.5.1. QI_GPIO_Init

This function enables the GPIO function of the specified pin, and initializes the configurations, including direction, level and pull selection.

- **Prototype**

```
s32 QI_GPIO_Init(PinName pinName, PinDirection dir, PinLevel level, PinPullSel pullsel)
```

- **Parameters**

pinName:

[in] Pin name, one value of Enum_PinName.

dir:

[in] The initial direction of GPIO, one value of Enum_PinDirection.

pullsel:

[in] The initial level of GPIO, one value of Enum_PinLevel.

level:

[in] Pull selection, one value of Enum_PinPullSel.

- **Return Value**

QL_RET_OK, this function succeeds. Negative integer indicates this function fails.

5.7.2.5.2. QI_GPIO_GetLevel

This function gets the level of the specified GPIO.

- **Prototype**

```
s32 QI_GPIO_GetLevel(PinName pinName)
```

- **Parameters**

pinName:

[in] Pin name, one value of "Enum_PinName".

- **Return Value**

Return the level of the specified GPIO. 1 means high level, 0 means low level.

5.7.2.5.3. QI_GPIO_SetLevel

This function sets the level of the specified GPIO.

- **Prototype**

```
s32 QI_GPIO_SetLevel(PinName pinName, PinLevel level)
```

- **Parameters**

pinName:

[in] Pin name, one value of "Enum_PinName".

level:

[in] The initial level of GPIO, one value of "Enum_PinLevel".

- **Return Value**

QL_RET_OK, this function succeeds. Negative integer indicates this function fails.

5.7.2.5.4. QI_GPIO_GetDirection

This function gets the direction of the specified GPIO.

- **Prototype**

```
s32 QI_GPIO_GetDirection(PinName pinName)
```

- **Parameters**

pinName:

[in] Pin name, one value of "Enum_PinName".

- **Return Value**

Return the direction of the specified GPIO, 1 means output, 0 means input.

5.7.2.5.5. QI_GPIO_SetDirection

This function sets the direction of the specified GPIO.

- **Prototype**

```
s32 QI_GPIO_SetDirection(PinName pinName, PinDirection dir)
```

- **Parameters**

pinName:

[in] Pin name, one value of "Enum_PinName".

dir:

[in] The initial direction of GPIO, one value of "Enum_PinDirection".

- **Return Value**

QL_RET_OK, this function succeeds. Negative integer indicates this function fails.

5.7.2.5.6. QI_GPIO_GetPullSelection

This function gets the pull selection of the specified GPIO.

- **Prototype**

```
s32 QI_GPIO_GetPullSelection(PinName pinName)
```

- **Parameters**

pinName:

[in] Pin name, one value of "Enum_PinName".

- **Return Value**

Return the pull selection of the specified GPIO, one value of "Enum_PinPullSel".

5.7.2.5.7. QI_GPIO_SetPullSelection

This function sets the pull selection of the specified GPIO.

- **Prototype**

```
s32 QI_GPIO_SetPullSelection(PinName pinName, PinPullSel pullSel)
```

- **Parameters**

pinName:

[in] Pin name, one value of "Enum_PinName".

pullSel:

[in] Pull selection, one value of "Enum_PinPullSel".

- **Return Value**

QL_RET_OK, this function succeeds. Negative integer indicates this function fails.

5.7.2.5.8. QI_GPIO_Uninit

This function releases the specified GPIO that was initialized by calling QI_GPIO_Init previously. After

releasing, the GPIO can be used for other purpose.

- **Prototype**

```
s32 QI_GPIO_Uninit(PinName pinName)
```

- **Parameters**

pinName:

[in] Pin name, one value of "Enum_PinName".

- **Return Value**

QL_RET_OK, this function succeeds. Negative integer indicates this function fails.

5.7.2.6. Example

This chapter gives the example of how to use the GPIO.

```
void API_TEST_gpio(void)
{
    s32 ret;
    QI_Debug_Trace("\r\n<***** GPIO API Test *****>\r\n");

    ret=QI_GPIO_Init(PINNAME_NETLIGHT, PINDIRECTION_OUT, PINLEVEL_HIGH,
PINPULLSEL_PULLUP);
    QI_Debug_Trace("\r\n<--pin(%d) QI_GPIO_Init ret=%d-->\r\n",PINNAME_NETLIGHT,ret);

    ret=QI_GPIO_SetLevel(PINNAME_NETLIGHT,PINLEVEL_HIGH);
    QI_Debug_Trace("\r\n<--pin(%d) QI_GPIO_SetLevel =%d ret=%d-->\r\n",
PINNAME_NETLIGHT,PINLEVEL_HIGH,ret);

    ret=QI_GPIO_SetDirection(PINNAME_NETLIGHT,PINDIRECTION_IN);
    QI_Debug_Trace("\r\n<--pin(%d) QI_GPIO_SetDirection =%d ret=%d-->\r\n",
PINNAME_NETLIGHT,PINDIRECTION_IN,ret);

    ret=QI_GPIO_GetLevel(PINNAME_NETLIGHT);
    QI_Debug_Trace("\r\n<--pin(%d) QI_GPIO_GetLevel =%d ret=%d-->\r\n",
PINNAME_NETLIGHT,ret,ret);

    ret=QI_GPIO_GetDirection(PINNAME_NETLIGHT);
    QI_Debug_Trace("\r\n<--pin(%d) QI_GPIO_GetDirection =%d ret=%d-->\r\n",
PINNAME_NETLIGHT,ret,ret);
}
```

```
ret=QI_GPIO_SetPullSelection(PINNAME_NETLIGHT,PINPULLSEL_PULLDOWN);
QI_Debug_Trace("\r\n<--pin(%d) QI_GPIO_SetPullSelection =%d ret=%d-->\r\n",
               PINNAME_NETLIGHT,PINPULLSEL_PULLDOWN,ret);

ret=QI_GPIO_GetPullSelection(PINNAME_NETLIGHT);
QI_Debug_Trace("\r\n<--pin(%d) QI_GPIO_GetPullSelection =%d ret=%d-->\r\n",
               PINNAME_NETLIGHT,ret,ret);

ret=QI_GPIO_Uninit(PINNAME_NETLIGHT);
QI_Debug_Trace("\r\n<--pin(%d) QI_GPIO_Uninit ret=%d-->\r\n",PINNAME_NETLIGHT,ret);
}
```

5.7.3. EINT

5.7.3.1. EINT Overview

OpenCPU module have two external interrupt pins, Please refer to [\[5.7.2.2\]](#) for details. The interrupt trigger mode just support level-triggered mode. And the software debounce for external interrupt sources in order to minimize the possibility of false activations. External interrupt have higher priority, so it is not allowed frequent interruption. It's strongly recommended that the interrupt frequency is not more than 2, and too frequent interrupt will cause other tasks cannot be scheduled, which probably leads unexpected exception.

5.7.3.2. EINT Usage

The following steps are how to use the external interruption function:

- Step 1:** Register an external interrupt function. You must choose one external interrupt pin and use QI_EINT_Register (or QI_EINT_RegisterFast) API to register an interrupt handler function.
- Step 2:** Initialize the interrupt configurations. Call QI_EINT_Init function to config the software debounce time, set level-triggered interrupt mode.
- Step 3:** Interrupt handle. The interrupt callback function will be called if the level has changed. And developers can process something in the handler.
- Step 4:** Mask the interrupt. When you do not want external interrupt you can use the QI_EINT_Mask function to disable the external interrupt, and you can call the QI_EINT_Unmask function to enable the external interrupt.
- Step 5:** Releases the specified EINT pin. To call QI_EINT_Uninit function to releases the specified EINT pin, and the pin can be used for other purpose after it released. This step is optional.

5.7.3.3. API Functions

5.7.3.3.1. QI_EINT_Register

This function registers an EINT I/O, and specifies the interrupt handler.

- **Prototype**

```
s32 QI_EINT_Register(PinName eintPinName, Callback_EINT_Handle callback_eint,void* customParam)
typedef void (*Callback_EINT_Handle)(PinName eintPinName, PinLevel pinLevel, void* customParam)
```

- **Parameters**

eintPinName:

[in] EINT pin name, one value of Enum_PinName that has the interrupt function.

callback_eint:

[in] The interrupt handler.

pinLevel:

[in] The EINT pin level value, one value of "Enum_PinLevel".

customParam:

[in] Customize parameter, if not use just set to NULL.

- **Return Value**

QL_RET_OK, this function succeeds. Negative integer indicates this function fails.

5.7.3.3.2. QI_EINT_RegisterFast

This function registers an EINT I/O, and specifies the interrupt handler. The EINT that is registered by calling this function is a tophalf interrupt. The response for interrupt request is timelier. Please don't add any task schedule in the interrupt handler.And the interrupt handler cannot consume much CPU time. Or it causes system exception or reset.

- **Prototype**

```
s32 QI_EINT_RegisterFast(PinName eintPinName, Callback_EINT_Handle callback_eint, void* customParam)
```

- **Parameters**

eintPinName:

[in] EINT pin name, one value of "Enum_PinName" that has the interrupt function.

callback_eint:

[in] The interrupt handler.

pinLevel:

[in] The EINT pin level value, one value of "Enum_PinLevel".

customParam:

[in] Customize parameter, if not use just set to NULL.

- **Return Value**

QL_RET_OK, this function succeeds. Negative integer indicates this function fails.

5.7.3.3.3. QI_EINT_Init

Initialize an external interrupt function.

- **Prototype**

```
s32 QI_EINT_Init(PinName eintPinName, EintType eintType, u32 hwDebounce, u32 swDebounce,
bool autoMask)
```

- **Parameters**

eintPinName:

[in] EINT pin name, one value of "Enum_PinName" that has the interrupt function.

eintType:

[in] Interrupt type, level-triggered or edge-triggered. Now, only level-triggered interrupt is supported.

hwDebounce:

[in] Hardware debounce. Unit: in 10ms. Not support now.

swDebounce:

[in] Software debounce. Unit: in 10ms. The minimum value for this parameter is 5, which means the minimum software debounce time is 5*10ms=50ms.

autoMask:

[in] Whether auto mask the external interrupt after the interrupt happened. 0 means not, 1 means yes.

- **Return Value**

QL_RET_OK, this function succeeds. Negative integer indicates this function fails.

5.7.3.3.4. QI_EINT_Uninit

This function releases the specified EINT pin.

- **Prototype**

```
s32 QI_EINT_Uninit(PinName eintPinName)
```

- **Parameters**

eintPinName:
[in] EINT pin name.

- **Return Value**

QL_RET_OK, this function succeeds. Negative integer indicates this function fails.

5.7.3.3.5. QI_EINT_GetLevel

This function gets the level of the specified EINT pin.

- **Prototype**

```
s32 QI_EINT_GetLevel(PinName eintPinName)
```

- **Parameters**

eintPinName:
[in] EINT pin name.

- **Return Value**

1 means high level, 0 means low level.

5.7.3.3.6. QI_EINT_Mask

This function masks the specified EINT pin.

- **Prototype**

```
void QI_EINT_Mask(PinName eintPinName)
```

- **Parameters**

eintPinName:
[in] EINT pin name.

- **Return Value**

Void.

5.7.3.3.7. QI_EINT_Unmask

This function unmask the specified EINT pin.

- **Prototype**

```
void QI_EINT_Unmask(PinName eintPinName)
```

- **Parameters**

eintPinName:
[in] EINT pin name.

- **Return Value**

None.

5.7.3.4. Example

The following sample codes show how to use the EINT function.

```
void eint_callback_handle(Enum_PinName eintPinName, Enum_PinLevel pinLevel, void* customParam)
{
    s32 ret;
    if(PINNAME_DTR==eintPinName) //Extern interrput from which pin
    {
        ret=QI_EINT_GetLevel(eintPinName); //Get the pin level if you need.

        //You need unmask the interrupt again, because PINNAME_DTR pin interrupt initialized as auto
        mask,
```

```
    QI_EINT_Unmask(eintPinName);
    if(*(s32*)customParam) >= 3)
    {
        //If don't want the interrupt you can mask it now !!!
        QI_EINT_Mask(eintPinName);
    }
}
else if(PINNAME_SIM_PRESENCE==eintPinName)
{
    ret=QI_EINT_GetLevel(eintPinName);
    QI_Debug_Trace("\r\n<--QI_EINT_GetLevel pin(%d) levle(%d)-->\r\n",eintPinName,ret);

    //QI_EINT_Unmask(eintPinName); not need, initialization this interrupt is not auto mask.
    if(*(s32*)customParam) >= 3)
    {
        //If don't want the interrupt you can mask it now !!!
        QI_EINT_Mask(PINNAME_SIM_PRESENCE);
    }
}
*((s32*)customParam) +=1;
}

void API_TEST_eint(void)
{
    s32 ret;

    //Register PINNAME_SIM_PRESENCE pin for a tophalf external interrupt pin
    ret=QI_EINT_RegisterFast(PINNAME_SIM_PRESENCE,eint_callback_handle,(void
*)&EintcustomParam);

    //Initialization some parameters, auto mask is false.
    ret=QI_EINT_Init(PINNAME_SIM_PRESENCE, EINT_LEVEL_TRIGGERED, 0,5,0);
    QI_Debug_Trace("\r\n<--pin(%d) QI_EINT_Init ret=%d-->\r\n",PINNAME_SIM_PRESENCE,ret);

    //Register PINNAME_DTR pin for a external interrupt pin
    ret=QI_EINT_Register(PINNAME_DTR,eint_callback_handle, (void *)&fastEintcustomParam);

    //Initialization some parameters, auto maks is true.
    ret=QI_EINT_Init( PINNAME_DTR, EINT_LEVEL_TRIGGERED, 0, 5,1);
}
```

5.7.4. PWM

5.7.4.1. PWM Overview

OpenCPU module have one PWM pin, Please refer to [\[5.7.2.2\]](#) for details. The pwm have two clock sources: one is 32K (the exact value is 32768Hz) and the other is 13M. When the module is in the sleep mode, the 13M clock source will be disabled, but the 32K clock source works normally.

5.7.4.2. PWM Usage

The following steps are how to use the PWM function:

Step 1: Initialize a PWM pin. Call `QI_PWM_Init` function to config the PWM duty cycle and frequency.

Step 2: PWM waveform control. Call `QI_PWM_Output` to switch on/off the PWM waveform output.

Step 3: Release the PWM pin. Call `QI_PWM_Uninit` to release the PWM pin. This step is optional.

5.7.4.3. API Functions

5.7.4.3.1. QI_PWM_Init

This function initializes the PWM pin.

- **Prototype**

```
s32 QI_PWM_Init(PinName pwmPinName,PwmSource pwmSrcClk,PwmSourceDiv pwmDiv,u32 lowPulseNum,u32 highPulseNum)
```

- **Parameters**

pwmPinName:

[in] Pin name, only can be `PINNAME_NETLIGHT`.

pwmSrcClk:

[in] PWM clock source, one value of "Enum_PwmSource".

pwmDiv:

[in] Clock source divide, one value of "Enum_PwmSourceDiv"

lowPulseNum:

[in] Set the number of clock cycles to stay at low level. The result of `lowPulseNum` plus `highPulse Num` is less than 8193.

highPulseNum:

[in] Set the number of clock cycles to stay at high level. The result of lowPulseNum plus highPulseNum is less than 8193.

NOTES

1. PWM Duty cycle= $\text{highPulseNum} / (\text{lowPulseNum} + \text{highPulseNum})$.
2. PWM frequency= $(\text{pwmSrcClk} / \text{pwmDiv}) / (\text{lowPulseNum} + \text{highPulseNum})$.

● Return Value

QL_RET_OK, this function succeeds. Negative integer indicates this function fails.

5.7.4.3.2. QI_PWM_Uninit

This function releases a PWM pin.

● Prototype

```
s32 QI_PWM_Uninit(PinName pwmPinName)
```

● Parameters

pwmPinName:

[in] Pin name, one value of "Enum_PinName".

● Return Value

QL_RET_OK, this function succeeds. Negative integer indicates this function fails.

5.7.4.3.3. QI_PWM_Output

This function switches on/off the PWM waveform output.

● Prototype

```
s32 QI_PWM_Output(PinName pwmPinName, bool pwmOnOff)
```

● Parameters

pwmPinName:

[in] Pin name, one value of "Enum_PinName".

pwmOnOff:

[in] PWM enable. Control the PWM waveform output or disable.

- **Return Value**

QL_RET_OK, this function succeeds. Negative integer indicates this function fails.

5.7.4.3.4. Example

This following sample codes show how to use the PWM.

```
void API_TEST_pwm(void)
{
    s32 ret;

    //Initialization some parameters.
    ret=QL_PWM_Init(PINNAME_NETLIGHT, PWMSOURCE_32K, PWMSOURCE_DIV4, 500, 500);
    QL_Debug_Trace("\r\n<--pin(%d) QL_PWM_Init ret=%d-->\r\n",PINNAME_NETLIGHT,ret);

    //PWM waveform output.
    ret=QL_PWM_Output(PINNAME_NETLIGHT, 1);
    QL_Debug_Trace("\r\n<--pin(%d) QL_PWM_Output start ret=%d-->\r\n",PINNAME_NETLIGHT,ret);

    QL_Sleep(3000);
    //PWM waveform stop.
    ret=QL_PWM_Output(PINNAME_NETLIGHT, 0);
    QL_Debug_Trace("\r\n<--pin(%d) QL_PWM_Output stop ret=%d-->\r\n",PINNAME_NETLIGHT,ret);

    //Release the pin if you do not use it.
    ret=QL_PWM_Uninit(PINNAME_NETLIGHT);
    QL_Debug_Trace("\r\n<--pin(%d) QL_PWM_Uninit stop ret=%d-->\r\n",PINNAME_NETLIGHT,ret);
}
```

5.7.5. CLOCK

5.7.5.1. CLOCK Overview

OpenCPU module provides one clock pin that can be programmed; Please refer to [\[5.7.2.2\]](#) for details. The clock pin can output four clock (26M, 13M, 6.5M, 32K) sources. And the 32K clock source can output event if the module is in sleep mode.

5.7.5.2. CLOCK Usage

The following steps tell how to use the CLOCK function:

Step 1: Initialize a CLOCK pin. Call QI_CLK_Init function to set a clock pin and choose the clock source.

Step 2: Clock output control. Call QI_CLK_Output function to switch on/off the clock waveform output.

Step 3: Release the CLOCK pin. Invoke QI_CLK_Uninit to release the CLOCK pin. This step is optional.

5.7.5.3. API Functions

5.7.5.3.1. QI_CLK_Init

This function initializes a clock pin.

- **Prototype**

```
s32 QI_CLK_Init(PinName clkName, ClockSource clkSrc)
```

- **Parameters**

clkName:

[in] Pin name, one value of "Enum_PinName".

clkSrc:

[in] Clock source, one value of "Enum_ClockSource".

- **Return Value**

QL_RET_OK, this function succeeds. Negative integer indicates this function fails.

5.7.5.3.2. QI_CLK_Uninit

This function releases a clock pin.

- **Prototype**

```
s32 QI_CLK_Uninit(PinName clkName)
```

- **Parameters**

clkName:

[in] Pin name, one value of "Enum_PinName".

- **Return Value**

QL_RET_OK, this function succeeds. Negative integer indicates this function fails.

5.7.5.3.3. QI_CLK_Output

This function controls clock on or off

- **Prototype**

```
s32 QI_CLK_Output(PinName pinName,bool clkOnOff)
```

- **Parameters**

clkName:

[in] Pin name, one value of "Enum_PinName".

clkOnOff:

[in] CLOCK enable. Control the CLOCK output or not output.

- **Return Value**

QL_RET_OK, this function succeeds. Negative integer indicates this function fails.

5.7.5.4. Example

The following example demonstrates the use of the CLOCK.

```
void API_TEST_clock(void)
{
    s32 ret;
    QI_Debug_Trace("\r\n<*****   CLOCK API Test   *****>\r\n");

    ret=QI_CLK_Init(PINNAME_DCD, CLOCKSOURCE_32K);
    QI_Debug_Trace("\r\n<--pin(%d) QI_CLK_Init ret=%d-->\r\n",PINNAME_DCD,ret);

    ret=QI_CLK_Output(PINNAME_DCD, 1);
    QI_Debug_Trace("\r\n<--pin(%d) QI_CLK_Output start ret=%d-->\r\n",PINNAME_DCD,ret);

    QI_Sleep(3000);
    ret=QI_CLK_Output(PINNAME_DCD, 0);
    QI_Debug_Trace("\r\n<--pin(%d) QI_CLK_Output stop ret=%d-->\r\n",PINNAME_DCD,ret);
}
```

```
ret=QI_CLK_Uninit(PINNAME_DCD);  
QI_Debug_Trace("\r\n<--pin(%d) QI_CLK_Uninit stop ret=%d-->\r\n",PINNAME_DCD,ret);  
}
```

5.7.6. ADC

5.7.6.1. ADC Overview

OpenCPU module provides an analogue input pins that can be used to detect the external voltage. Please refer to document [\[2\]](#) for the pin definitions and ADC h/w characteristics. The voltage range that can be detected is 0~2800mV.

5.7.6.2. ADC Usage

The following steps tell the use of the ADC function:

- Step 1:** Register an ADC sampling function. Call QI_ADC_Register function to register a callback function which will be invoked after ADC has sampled count times.
- Step 2:** ADC sampling parameter initialization. Call QI_ADC_Init function to set the sample counts and the interval of each sample.
- Step 3:** Start/stop ADC sampling. Use QI_ADC_Sampling function with an enable parameter to start ADC sampling, and then ADC callback function will be invoked cyclically to report the ADC value. Again call this API function with a disable parameter may stop the ADC sampling.

5.7.6.3. API Functions

5.7.6.3.1. QI_ADC_Register

This function registers an ADC callback function. The callback function will be called after ADC has sampled count times.

- **Prototype**

```
s32 QI_ADC_Register(ADCPin adcPin, Callback_ADC callback_adc, void *customParam)  
typedef void (*Callback_ADC)(ADCPin adcPin, u32 adcValue, void *customParam)
```

- **Parameters**

adcPin:

[in] ADC pin name, one value of "Enum_ADCPin".

callback_adc:

[in] Callback function, will be called after ADC has sampled count times.

customParam:

[in] Customize parameter, if not use just set to NULL.

adcValue :

[in] The ADC value is the average of the sampled count times. The range is 0~2800 mV.

- **Return Value**

QL_RET_OK, this function succeeds. Negative integer indicates this function fails.

5.7.6.3.2. QI_ADC_Init

This function initializes the configurations for ADC, including sampling count and the interval of each sampling. The ADC callback function will be called after ADC has sampled count times to report the ADC value, and the value is the average of the count times sampling.

- **Prototype**

```
s32 QI_ADC_Init(ADCPin adcPin,u32 count,u32 interval)
```

- **Parameters**

adcpin:

[in] ADC pin name, one value of "Enum_ADCPin".

count:

[in] Internal sampling times for each reporting ADC value. The minimum is 5.

interval:

[in] Interval of each internal sampling, unit is ms. the minimum is 200 (ms). That means the ADC Report frequency must be less than 1 Hz.

- **Return Value**

QL_RET_OK, this function succeeds. Negative integer indicates this function fails.

5.7.6.3.3. QI_ADC_Sampling

This function switches on/off ADC sample.

- **Prototype**

```
s32 QI_ADC_Sampling(ADCPin adcPin, bool enable)
```

- **Parameters**

adcPin:

[in] ADC pin name, one value of "Enum_ADCPin".

enable:

[in] Sample control, 1: start to sample 0: stop sampling.

- **Return Value**

QL_RET_OK, this function succeeds. Negative integer indicates this function fails.

5.7.6.4. Example

The following example demonstrates the use of the ADC sample.

```
void ADC_callback_handle(Enum_ADCPin adcPin, u32 adcValue, void *customParam)
{
    s32 ret;
    if (PIN_ADC0==adcPin )
    {
        if( *((s32*)customParam) >= 4)
        {
            //Stop ADC0 to sample, if you not need
            ret=QI_ADC_Sampling(PIN_ADC0, 0);
        }
    }
    *((s32*)customParam) +=1;
}

void API_TEST_adc(void)
{
    s32 ret;

    //Register ADC0 callback function.
    ret=QI_ADC_Register(PIN_ADC0, ADC_callback_handle, (void *)&ADC0customParam);

    //Set the internal sampling times, the each internal sampling interval
    ret=QI_ADC_Init(PIN_ADC0, 5, 200); //So the ADC0 report the ADC value frequency 1 Hz.(5*200ms).
    ret=QI_ADC_Sampling(PIN_ADC0, 1); //Start to sample
}
```

5.7.7. IIC

5.7.7.1. IIC Overview

In OpenCPU, IIC interface is simulated by GPIO pins, which can be any two GPIOs in the GPIO list [5.7.2.2]. So, one or more IIC interfaces are possible.

5.7.7.2. IIC Usage

The following steps tell how to work with IIC function:

Step 1: Initialize IIC interface. Call QI_IIC_Init function to initialize an IIC channel, including the specified GPIO pins for IIC and an IIC channel number.

Step 2: Configure IIC interface. Call QI_IIC_Config to config parameters that the slave device needs. Please refer to the API decription for extend information.

Step 3: Read data from slave. Developer can use QI_IIC_Read function to read data from the specified slave. The following figure shows the data exchange direction.

Step 4: Write data to slave. Developer can use QI_IIC_Write function to write data to the specified slave. The following figure shows the data exchange direction.

Step 5: Write the data to the register (or the specified address) of the slave. Developer can use QI_IIC_Write function to write the data to a register of the slave. The following figure shows the data exchange direction.

Step 6: Read the data from the register (or the specified address) of the slave. Developer can use QI_IIC_Write_Read function to read the data from a register of the slave. The following figure shows the data exchange direction.

Step 7: Release the IIC channel. Call QI_IIC_Uninit function to release the specified IIC channel.

5.7.7.3. API Functions

5.7.7.3.1. QI_IIC_Init

This function initializes the configurations for an IIC channel, including the specified pins for IIC, IIC type, and IIC channel number.

- **Prototype**

```
s32 QI_IIC_Init(u32 chnnlNo, PinName pinSCL, PinName pinSDA, u32 IICtype)
```

- **Parameters**

chnnlNo:

[in] IIC channel No, the range is 0~254.

pinSCL:

[in] IIC SCL pin.

pinSDA:

[in] IIC SDA pin.

//Ctype:

[in] IIC type, 0 means the IIC communication is simulated by pins, 1 means IIC contronller.

- **Return Value**

QL_RET_OK, this function succeeds. Negative integer indicates this function fails.

5.7.7.3.2. QI_IIC_Config

This function configures the IIC interface for one slave.

- **Prototype**

```
s32 QI_IIC_Config(u32 chnnlNo, bool isHost, u8 slaveAddr, u32 speed)
```

- **Parameters**

chnnlNo:

[in] IIC channel No, the No is specified by QI_IIC_Init function.

isHost :

[in] Must be true, just support host mode.

slaveAddr:

[in] Slave address.

speed:

[in] Just for IIC controller, and the parameter can be ignored if you use simulate IIC

- **Return Value**

QL_RET_OK, this function succeeds. Negative integer indicates this function fails.

5.7.7.3.3. QI_IIC_Write

This function writes data to specified slave through IIC interface.

- **Prototype**

```
s32 QI_IIC_Write(u32 chnnlNo,u8 slaveAddr,u8 *pData,u32 len)
```

- **Parameters**

chnnlNo:

[in] IIC channel No, the No is specified by QI_IIC_Init function.

slaveAddr:

[in] Slave address.

pData:

[in] Setting value to slave.

Len:

[in] Number of bytes to write. If IICtype=1, 1<len<8. Because our IIC controller at most support 8 bytes for one time transaction

- **Return Value**

If no error, return the length of the write data. Negative integer indicates this function fails.

5.7.7.3.4. QI_IIC_Read

This function reads data from specified slave through IIC interface.

- **Prototype**

```
s32 QI_IIC_Read(u32 chnnlNo,u8 slaveAddr,u8 *pBuffer,u32 len)
```

- **Parameters**

chnnlNo:

[in] IIC channel No, the No is specified by QI_IIC_Init function.

slaveAddr:

[in] Slave address.

pBuffer:

[Out] Read buffer of reading the specified register from slave.

Len:

[Out] Number of bytes to read. If IICtype=1, 1<len<8. Because our IIC contronller at most support 8 bytes for one time transaction.

- **Return Value**

If no error, return the length of the read data. Negative integer indicates this function fails.

5.7.7.3.5. QI_IIC_WriteRead

This function reads data form the specified register (or address) of the specified slave.

- **Prototype**

```
s32 QI_IIC_Write_Read(u32 chnnlNo,u8 slaveAddr,u8 * pData,u32 wrtLen,u8 * pBuffer,u32 rdLen)
```

- **Parameters**

chnnlNo:

[in] IIC channel No, the No is specified by QI_IIC_Init function.

slaveAddr:

[in] Slave address.

pData:

[in] Setting values of the specified register of the slave.

wrtLen:

[in] Number of bytes to write.If IICtype=1, 1<wrtLen<8.

pBuffer:

[Out] Read buffer of reading the specified register from slave.

rdLen:

[Out] Number of bytes to read.If IICtype=1, 1<wrtLen<8.

- **Return Value**

If no error, return the length of the read data. Negative integer indicates this function fails.

5.7.7.3.6. QI_IIC_Uninit

This function releases the pins.

- **Prototype**

```
s32 QI_IIC_Uninit(u32 chnnlNo)
```

- **Parameters**

chnnlNo:

[in] IIC channel No, the No is specified by QI_IIC_Init function.

- **Return Value**

QL_RET_OK, this function succeeds. Negative integer indicates this function fails.

5.7.7.4. Example

The following example code demonstrates the use of IIC interface.

```
void API_TEST_iic(void)
{
    s32 ret;
    u8 write_buffer[4]={0x10,0x02,0x50,0x0a};
    u8 read_buffer[6]={0x14,0x22,0x33,0x44,0x55,0x66};
    u8 registerAddr[2]={0x01,0x45};
    QI_Debug_Trace("\r\n<***** IIC API Test *****>\r\n");

    //Simultion iic test
```

```
ret=QI_IIC_Init(0,PINNAME_GPIO0,PINNAME_GPIO1,0);

//Simultion IIC interface ,do not care the licSpeed.
ret=QI_IIC_Config(0, TRUE,0x07, 0);

ret=QI_IIC_Write(0, 0x07, write_buffer, sizeof(write_buffer));
ret=QI_IIC_Read(0, 0x07, read_buffer, sizeof(read_buffer));
ret=QI_IIC_Write_Read(0, 0x07, registerAddr, sizeof(registerAddr),read_buffer, sizeof(read_buffer));

//IIC controller test
ret=QI_IIC_Init(1,PINNAME_GPIO8,PINNAME_GPIO9,1);

//IIC controller speed is necessary
ret=QI_IIC_Config(1, TRUE, 0x07, 300);

ret=QI_IIC_Write(1, 0x07, write_buffer, sizeof(write_buffer));
ret=QI_IIC_Read(1, 0x07, read_buffer, sizeof(read_buffer));
ret=QI_IIC_Write_Read(1, 0x07, registerAddr, sizeof(registerAddr),read_buffer, sizeof(read_buffer));

ret=QI_IIC_Uninit(1);
}
```

5.7.8. SPI

5.7.8.1. SPI Overview

In OpenCPU, SPI interface is simulated by GPIO pins, which can be any GPIOs in the GPIO list [\[5.7.2.2\]](#).

5.7.8.2. SPI Usage

The following steps tell how to use the SPI function:

- Step 1:** Initialize SPI Interface. To call QI_SPI_Init function initializes the configurations for a SPI channel, including the specified pins for SPI, SPI type, and SPI channel number.
- Step 2:** Configure. Call QI_SPI_Config function to config some parameters for the SPI interface, including the clock polarity and clock phase.
- Step 3:** Write data. To call QI_SPI_Write function writes bytes to the specified slave bus.
- Step 4:** Read data. To call QI_SPI_Read function reads bytes from the specified slave bus.
- Step 5:** Write and read. The QI_SPI_WriteRead function is for SPI full-duplex communication that can read and write data at one time.
- Step 6:** Release SPI interface. Invoke QI_SPI_Uninit function to release the SPI PINs. This step is optional.

5.7.8.3. API Functions

5.7.8.3.1. QI_SPI_Init

This function initializes the configurations for a SPI channel, including the SPI channel number and the specified GPIO pins for SPI.

- **Prototype**

```
s32 QI_SPI_Init(u32 chnnlNo,PinName pinClk,PinName pinMiso,PinName pinMosi,bool spiType)
```

- **Parameters**

chnnlNo:

[in] SPI channel No, the range is 0~254

pinClk:

[in] SPI CLK pin.

pinMiso:

[in] SPI MISO pin.

pinMosi:

[in] SPI MOSI pin.

spiType:

[in] SPI type, the type must be zero.

- **Return Value**

QL_RET_OK, this function succeeds. Negative integer indicates this function fails.

5.7.8.3.2. QI_SPI_Config

This function configures the SPI interface.

- **Prototype**

```
s32 QI_SPI_Config (u32 chnnlNo, bool isHost, bool cpol, bool cpha, u32 clkSpeed)
```

- **Parameters**

chnnlNo:

[in] SPI channel No, the No is specified by QI_SPI_Init function.

isHost:

[in] Must be true, not support slave mode.

cpol:

[in] Clock Polarity, more information please refer to the SPI standard protocol.

cpha:

[in] Clock Phase, more information please refer to the SPI standard protocol.

clkSpeed:

[in] The SPI speed, not support now. The input argument will be ignored.

- **Return Value**

If no error, return the length of the write data. Negative integer indicates this function fails

5.7.8.3.3. QI_SPI_Write

This function writes data to the specified slave through SPI interface.

- **Prototype**

```
s32 QI_SPI_Write(u32 chnnlNo,u8 * pData,u32 len)
```

- **Parameters**

chnnlNo:

[in] SPI channel No, the No is specified by QI_SPI_Init function.

pData:

[in] The setting value to slave.

len:

[in] Number of bytes to write.

- **Return Value**

If no error, return the length of the write data. Negative integer indicates this function fails.

5.7.8.3.4. QI_SPI_Read

This function reads data from the specified slave through SPI interface.

- **Prototype**

```
s32 QI_SPI_Read(u32 chnnlNo,u8 *pBuffer,u32 rdLen)
```

- **Parameters**

chnnlNo:

[in] SPI channel No, the No is specified by QI_SPI_Init function.

pBuffer:

[Out] Read buffer of reading from slave.

rdLen:

[Out] Number of bytes to read.

- **Return Value**

If no error, return the length of the read data. Negative integer indicates this function fails.

5.7.8.3.5. QI_SPI_WriteRead

This function is used for SPI full-duplex communication.

- **Prototype**

```
s32 QI_SPI_WriteRead(u32 chnnlNo,u8 *pData,u32 wrtLen,u8 * pBuffer,u32 rdLen)
```

- **Parameters**

chnnlNo:

[in] SPI channel No, the No is specified by QI_SPI_Init function.

pData:

[in] Setting value to slave.

wrtLen:

[in] Number of bytes to write.

pBuffer:

[Out] Read buffer of reading from slave.

rdLen:

[Out] Number of bytes to read.

NOTES

1. If (wrtLen>rdLen), the other read buffer data will be set 0xff;
2. If (rdLen>wrtLen), the other write buffer data will be set 0xff;

● Return Value

If no error, return the length of the read data. Negative integer indicates this function fails.

5.7.8.3.6. QI_SPI_Uninit

This function releases the SPI pins.

● Prototype

```
s32 QI_SPI_Uninit(u32 chnnlNo)
```

● Parameters

chnnlNo:

[in] SPI channel No, the No is specified by QI_SPI_Init function.

● Return Value

QL_RET_OK, this function succeeds. Negative integer indicates this function fails

5.7.8.4. Example

The following example shows the use of the SPI interface.

```
void API_TEST_spi(void)
{
    s32 ret;
    u32 rdLen=0;
    u32 wdLen=0;
    u8 spi_write_buffer[]={0x01,0x02,0x03,0x0a,0x11,0xaa};
    u8 spi_read_buffer[100];
    QI_Debug_Trace("\r\n<***** TEST API Test *****>\r\n");

    ret=QI_SPI_Init(1,PINNAME_KBR0,PINNAME_KBR1,PINNAME_KBR2,0);
    QI_Debug_Trace("\r\n<--SPI channel 1 QI_SPI_Init ret=%d-->\r\n",ret);
```

```
ret=QI_SPI_Config(1,1,1,1,0);// isHost=1, cpol=1, cpha=1,  
QI_Debug_Trace("<--QI_SPI_Config(), SPI channel 1, ret=%d-->",ret);  
  
wdLen=QI_SPI_Write(1,spi_write_buffer,6);  
QI_Debug_Trace("\r\n<--SPI channel 1 QI_SPI_Write data len =%d-->\r\n",wdLen);  
  
rdLen=QI_SPI_Read(1,spi_read_buffer,6);  
QI_Debug_Trace("\r\n<--SPI channel 1 QI_SPI_Read data len =%d-->\r\n",rdLen);  
  
rdLen=QI_SPI_WriteRead(1,spi_write_buffer,6,spi_read_buffer,3);  
QI_Debug_Trace("\r\n<--SPI channel 1 QI_SPI_WriteRead Read data len =%d-->\r\n",rdLen);  
  
ret=QI_SPI_Uninit(1);  
QI_Debug_Trace("\r\n<--SPI channel 1 QI_SPI_Uninit ret =%d-->\r\n",ret);  
}
```

5.8. GPRS API

5.8.1. Overview

The API functions in this section are declared in “*ql_gprs.h*”.

The module supports to define and activate 2 PDP contexts at the same time. And each PDP context supports at most 6 client socket connections and 5 server socket connections.

The examples in the “example_tcpclient.c” and “example_tcpserver.c” of OpenCPU SDK show the proper usages of these methods.

5.8.2. Usage

The following steps tell how to work with GPRS PDP context:

- Step 1: Register PDP callback.** Call function QI_GPRS_Register to register the GPRS's callback function.
- Step 2: Set PDP context.** Call function QI_GPRS_Config to configure the GPRS PDP context, including APN name, user name and password.
- Step 3: Activate PDP.** Call function QI_GPRS_Activate to activate the GPRS PDP context. The result for activating GPRS will usually be informed in Callback_GPRS_Actived. See also the description for QI_GPRS_Activate below.

To call QI_GPRS_ActivateEx may activate the GPRS and get the result when this API function

returns. The callback function `Callback_GPRS_Actived` will not be invoked. It means this API function will execute with blocking mode. See also the description for `QI_GPRS_ActivateEx` below.

The maximum possible time for Activating GPRS is 180s.

Step 4: Get local IP. Call function `QI_GPRS_GetLocalIPAddress` to get the local IP address.

Step 5: Get host IP by domain name if needed. Call `QI_GPRS_GetDNSAddress` to retrieve the host IP address by the domain name address if a domain name address for server is used.

Step 6: Deactivate. Call function `QI_GPRS_Deactivate` to close the GPRS PDP context. The result for deactivating GPRS is usually be informed in `Callback_GPRS_Deactivated`. Besides, the callback function `Callback_GPRS_Deactivated` will be invoked when GPRS drops down. See also the description for `QI_GPRS_Activate` below.

To call `QI_GPRS_DeactivateEx` may deactivate the GPRS and get the result when this API function returns. The callback function `Callback_GPRS_Deactivated` will not be invoked. It means this API function will execute with blocking mode. See also the description for `QI_GPRS_DeactivateEx` below.

The maximum possible time for Deactivating GPRS is 90s.

5.8.3. API Functions

5.8.3.1. QI_GPRS_Register

This function registers the GPRS related callback functions. The callback functions will be invoked only in the registered task.

● Prototype

```
s32 QI_GPRS_Register(u8 contextId, ST_PDPContxt_Callback* callback_func, void* ustomParam)
```

```
typedef struct {
    void (*Callback_GPRS_Actived)(u8 contexId, s32 errCode, void* customParam);
    void (*CallBack_GPRS_Deactivated)(u8 contextId, s32 errCode, void* customParam );
} ST_PDPContxt_Callback;
```

● Parameters

contextid:

[in] OpenCPU supports two PDP-contexts to the destination host at a time. This parameter can be 0 or 1.

callback_func:

[in] This callback function is called by OpenCPU to inform Embedded Application whether this function

succeeds or not. And this callback function should be implemented by Embedded Application.

customerParam:

[in] One customized parameter that can be passed into the callback functions.

- **Return Value**

The return value is 0 if successes. Otherwise, a value of “*Enum_SocError*” is returned.

5.8.3.2. Callback_GPRS_Actived

When the return value of QI_GPRS_Activate is SOC_WOULDBLOCK, this callback function will be invoked later.

- **Prototype**

```
void (*Callback_GPRS_Actived)(u8 contextId, s32 errCode, void* customParam)
```

- **Parameters**

contextId:

[Out] PDP context id that is specified when calling QI_GPRS_Activate. This parameter maybe is 0 or 1.

errCode:

[Out] The result code of activating GPRS, 0 indicates succeed in activating GPRS.

customerParam:

[Out] One customized parameter that was passed into when calling QI_GPRS_Register. This paramer maybe is NULL.

- **Return Value**

None.

5.8.3.3. CallBack_GPRS_Deactivated

When the return value of QI_GPRS_Deactivate is SOC_WOULDBLOCK, this callback function will be invoked by Core System later.

- **Prototype**

```
void (*CallBack_GPRS_Deactivated)(u8 contextId, s32 errCode, void* customParam )
```

- **Parameters**

contextId:

[Out] PDP context id that is specified when calling GPRS_Activate. This parameter maybe is 0 or 1.

errCode:

[Out] The result code of activating GPRS, 0 indicates succeed in activating GPRS.

customerParam:

[Out] One customized parameter that was passed into when calling QI_GPRS_Register. This paramer maybe is NULL.

- **Return Value**

None.

5.8.3.4. QI_GPRS_Config

This function sets the authentication parameters apn/login/password/authentication to use with a profile ID during PDP activation.

- **Prototype**

```
s32 QI_GPRS_Config(u8 contextId, ST_GprsConfig* cfg)
```

```
typedef struct {  
    u8 apnName[MAX_GPRS_APN_LEN];  
    u8 apnUserId[MAX_GPRS_USER_NAME_LEN];  
    u8 apnPasswd[MAX_GPRS_PASSWORD_LEN];  
    u8 authtype; // pap or chap  
    void* Reserved1; // Qos  
    void* Reserved2; //  
} ST_GprsConfig;
```

- **Parameters**

apnName:

[in] NULL-terminated APN characters.

apnUserId:

[in] User Id, NULL-terminated characters.

apnPasswd:

[in] Password, NULL-terminated characters.

Authtype:

[in] Authentication method

1 - PAP

2- CHAP

- **Return Value**

The possible return values are as follows:

SOC_SUCCESS: This function succeeds.

SOC_INVALID: Invalid argument.

SOC_ALREADY: The function is running.

5.8.3.5. QI_GPRS_Activate

This function activates a PDP context. Depending on the network status, PDP activation will take some time, the longest activation time is 150s. When the PDP activation success or failure, *Callback_GPRS_Actived* callback function will be called, and give the activation result.

- **Prototype**

```
s32 QI_GPRS_Activate(u8 contextId)
```

- **Parameters**

contextId:

[in] OpenCPU supports two PDP-contexts to the destination host at the same time. This parameter can be 0 or 1.

- **Return Value**

The possible return values are below:

GPRS_PDP_SUCCESS: This function succeeds, and activating GPRS succeeds.

GPRS_PDP_WOULDBLOCK: The app should wait, till the callback function is called.

The app gets the information of success or failure in callback function.

The maximum possible time for Activating GPRS is 180s.

GPRS_PDP_INVALID: Invalid argument.

GPRS_PDP_ALREADY: The activating operation is in process.

GPRS_PDP_BEARER_FAIL: Bearer is broken.

- **Example**

The following codes show the activating GPRS processing.

```
{
    s32 ret;
    ret=QI_GPRS_Activate(0);
    if (GPRS_PDP_SUCCESS==ret)
    {
        //Activate GPRS successfully
    }
    else if (GPRS_PDP_WOULDBLOCK==ret)
    {
        //Activating GPRS, need to wait Callback_GPRS_Actived for the result
    }
    else if (GPRS_PDP_ALREADY==ret)
    {
        //GPRS has been activating...
    }else{
        //Fail to activate GPRS, error code is in "ret".
        //Developer may retry to activate GPRS, and reset the module after 3 successive failures.
    }
}
```

5.8.3.6. QI_GPRS_ActivateEx

This function activates the specified PDP context. The maximum possible time for Activating GPRS is 180s.

This function supports two modes:

- **Non-blocking Mode**

When the "isBlocking" is set to FALSE, this function works under non-blocking mode. The result will be returned even if the operation is not done, and the result will be reported in callback.

- **Blocking Mode**

When the "isBlocking" is set to TRUE, this function works under blocking mode. The result will be returned only after the operation is done.

If working under non-blocking mode, this function is same as QI_GPRS_Activate() functionally.

- **Prototype**

```
s32 QI_GPRS_ActivateEx(u8 ctxxtId, bool isBlocking);
```

- **Parameters**

contextId:

[in] OpenCPU supports two PDP-contexts to the destination host at the same time. This parameter can be 0 or 1.

isBlocking

[in] Blocking mode. TRUE=blocking mode, FALSE=non-blocking mode.

- **Return Value**

The possible return values are below:

GPRS_PDP_SUCCESS: This function succeeds, and activating GPRS succeeds.

GPRS_PDP_INVALID: Invalid argument.

GPRS_PDP_ALREADY: The activating operation is in process.

GPRS_PDP_BEARER_FAIL: Bearer is broken.

- **Example**

The following codes show the activating GPRS processing.

```
{
    s32 ret;
    ret=QI_GPRS_Activate(0, TRUE);
    if (GPRS_PDP_SUCCESS==ret)
    {
        //Activate GPRS successfully
    }
    else if (GPRS_PDP_ALREADY==ret)
    {
        //GPRS has been activating...
    }else{
        //Fail to activate GPRS, error code is in "ret".
        //Developer may retry to activate GPRS, and reset the module after 3 successive failures.
    }
}
```

5.8.3.7. QI_GPRS_Deactivate

This function deactivates the specified PDP context. Depending on the network status, PDP deactivation will take some time, the longest time is 90s. When the PDP deactivation success or failure, Callback_GPRS_Deactivated callback function will be called, and give the activation result

- **Prototype**

```
s32 QI_GPRS_Deactivate(u8 contextId)
```

- **Parameters**

contextId:

[in] PDP context ID that is specified when calling QI_GPRS_Activate.

- **Return Value**

The return value is 0 if this function succeeds. Otherwise, a value of "*qi_soc_error_enum*" is returned, please see Possible Error Codes.

- **Example**

The following codes show the deactivating GPRS processing.

```
{  
    s32 ret;  
    ret=QI_GPRS_Deactivate(0);  
    if (GPRS_PDP_SUCCESS==ret)  
    {  
        //GPRS is deactivated successfully  
    }  
    else if (GPRS_PDP_WOULDBLOCK==ret)  
    {  
        //Deactivating GPRS, need to wait Callback_GPRS_Deactivated for the result  
    }else{  
        //Fail to activate GPRS, error code is in "ret".  
    }  
}
```

5.8.3.8. QI_GPRS_DeactivateEx

This function deactivates the specified PDP context. The maximum possible time for Activating GPRS is 90s.

This function supports two modes:

- **Non-blocking Mode**

When the "isBlocking" is set to FALSE, this function works under non-blocking mode. The result will be returned even if the operation is not done, and the result will be reported in callback.

- **Blocking Mode**

When the "isBlocking" is set to TRUE, this function works under blocking mode. The result will be

returned only after the operation is done.

If working under non-blocking mode, this function is same as QI_GPRS_Deactivate() functionally.

- **Prototype**

```
s32 QI_GPRS_DeactivateEx(u8 contextId, bool isBlocking);
```

- **Parameters**

contextId:

[in] PDP context ID that is specified when calling QI_GPRS_Activate.

isBlocking

[in] Blocking mode. TRUE=blocking mode, FALSE=non-blocking mode.

- **Return Value**

The possible return values are below:

GPRS_PDP_SUCCESS: This function succeeds, and activating GPRS succeeds.

GPRS_PDP_INVALID: Invalid argument.

GPRS_PDP_ALREADY: The activating operation is in process.

GPRS_PDP_BEARER_FAIL: Bearer is broken.

- **Example**

The following codes show the deactivating GPRS processing.

```
{  
    s32 ret;  
    ret=QI_GPRS_Deactivate(0, TRUE);  
    if (GPRS_PDP_SUCCESS==ret)  
    {  
        //GPRS is deactivated successfully  
    }else{  
        //Fail to activate GPRS, error code is in "ret".  
    }  
}
```

5.8.3.9. QI_GPRS_GetLocalIPAddress

This function retrieves the local IP of the specified PDP context.

- **Prototype**

```
s32 QI_GPRS_GetLocalIPAddress(u8 contextId, u32* ipAddr)
```

- **Parameters**

contextId:

[in] PDP context ID that is specified when calling QI_GPRS_Activate.

ipAddr:

[Out] Point to the buffer that is the storage space for the local IPv4 address.

- **Return Value**

If no error occurs, this return value will be *SOC_SUCCESS* (0). Otherwise, a value of “*Enum_SocError*” is returned.

5.8.3.10. QI_GPRS_GetDNSAddress

This function retrieves the DNS server's IP addresses, which include the first DNS address and the second DNS address.

- **Prototype**

```
s32 QI_GPRS_GetDNSAddress(u8 contextId, u32* firstAddr, u32* secondAddr)
```

- **Parameters**

contextId:

[in] PDP context ID that is specified when calling QI_GPRS_Activate.

firstAddr:

[Out] Point to the buffer that is the storage space for the primary DNS server's IP address.

secondAddr:

[Out] Point to the buffer that is the storage space for the secondary DNS server's IP address.

- **Return Value**

If no error occurs, this return value will be *SOC_SUCCESS* (0). Otherwise, a value of “*Enum_SocError*” is returned.

5.8.3.11. QI_GPRS_SetDNS Address

This function sets the DNS server's IP address.

- **Prototype**

```
s32 QI_GPRS_SetDNSAddress(u8 contextId, u32 firstAddr, u32 secondAddr)
```

- **Parameters**

contextId:

[in] PDP context ID that is specified when calling QI_GPRS_Activate.

firstAddr:

[in] A u32 integer that stores the IPv4 address.

secondAddr:

[in] A u32 integer that stores IPv4 address.

- **Return Value**

If no error occurs, this return value will be `SOC_SUCCESS` (0). Otherwise, a value of "*Enum_SocError*" is returned.

5.9. Socket API

5.9.1. Overview

Socket program implements the TCP and UDP protocols. In OpenCPU, developer uses the API functions to program TCP/UDP, instead of AT commands. Each PDP context supports at most 6 client socket connections and 5 server socket connections.

The API functions in this section are declared in "*ql_socket.h*".

5.9.2. Usage

5.9.2.1. TCP Client Socket Usage

The following steps tell how to work with tcp client socket:

- Step 1: Register.** Call function `QI_SOC_Register` to register the socket-related callback functions.
- Step 2: Create socket.** Call function `QI_SOC_Create` to create a socket. The 'contextId' argument should be the same as `QI_GPRS_Register` uses, and the 'socketType' should be set as 'SOCK_TCP'.
- Step 3: Connect to socket.** Call `QI_SOC_Connect` to request a socket connection. The `callback_socket_connect` function will be invoked whether the connection is successful or not.
- Step 4: Send data to socket.** Call function `QI_SOC_Send` to send data. After the data is sent out and you can call `QI_SOC_GetAckNumber` function to check whether the data is received by the server. If `QI_SOC_Send` returns 'SOC_WOULDBLOCK', the App must wait `callback_socket_write` Function to send data again.
- Step 5: Receive data from socket.** When there's data coming from the socket, the `Callback_socket_read` function will be invoked to inform App. When received the notification, App may call `QI_SocketRecv` to receive the data. App must read out all of the data. Otherwise, the callback function will not be invoked when new data comes.
- Step 6: Close socket.** Call function `QI_SOC_Close` to close the socket. App can call function `QI_SOC_Close` to close the socket. When App receives the notification that server side has closed the socket, App has to call `QI_SOC_Close` to close the socket from client side.

5.9.2.2. TCP Server Socket Usage

The following steps tell how to work with the TCP Server:

- Step 1: Register.** Call function `QI_SOC_Register` to register the socket-related callback functions.
- Step 2: Create Socket.** Call function `QI_SOC_Create` to create a socket.
- Step 3: Bind.** Call function `QI_SOC_Bind` to associate a local address with a socket.
- Step 4: Listen.** Call function `QI_SOC_Listen` to start to listen to the connection request from listening port.
- Step 5: Accept connection request.** When a connection request comes, `callback_socket_accept` will be invoked to inform App. App can call function `QI_SOC_Accept` to accept the connection request.
- Step 6: Send data to socket.** Call function `QI_SOC_Send` to send data to socket. After the data is sent out and you can call `QI_SOC_GetAckNumber` function to check whether the data is received by the client. When this function returns 'SOC_WOULDBLOCK', the App has to wait till `callback_socket_write` is invoked, and then App can continue to send data.
- Step 7: Receive data from socket.** When data comes from the socket, the `Callback_socket_read` will be invoked to inform App. App can call `QI_SocketRecv` to receive the data. App must read out all of the data. Otherwise, the callback function will not be invoked when new data comes.
- Step 8: Close socket.** Call function `QI_SOC_Close` to close the socket. App can call function `QI_SOC_Close` to close the socket. When App receives the notification that client side has closed the socket, App has to call `QI_SOC_Close` to close the socket from server side.

5.9.2.3. UDP Service Socket Usage

The following steps tell how to work with UDP Server:

Step 1: Register. Call function `QI_SOC_Register` to register the socket-related callback functions.

Step 2: Create socket. Call function `QI_SOC_Create` to create a socket. The 'contextId' argument should be the same as `QI_GPRS_Register` uses, and the 'socketType' should be set as 'SOCK_UDP'.

Step 3: Bind. Call function `QI_SOC_Bind` to associate a local address with a socket.

Step 4: Send data to socket. Call function `QI_SOC_SendTo` to send data. When this function returns 'SOC_WOULDBLOCK', the App has to wait till `callback_socket_write` is invoked, and then App can continue to send data.

Step 5: Receive data from socket. When data comes from the socket, the `Callback_socket_read` function will be invoked to inform App and App can call `QI_SocketRecvFrom` to receive the data. App must read out all of the data. Otherwise, the callback function will not be invoked when new data comes.

Step 6: Close socket. Call function `QI_SOC_Close` to close the socket. App can call function `QI_SOC_Close` to close the socket.

5.9.3. API Functions

5.9.3.1. QI_SOC_Register

This function registers callback functions for the specified socket.

- **Prototype**

```
s32 QI_SOC_Register(ST_SOC_Callback cb, void* customParam)
```

```
typedef struct {  
    void (*callback_socket_connect)(s32 socketId, s32 errCode, void* customParam );  
    void (*callback_socket_close)(s32 socketId, s32 errCode, void* customParam );  
    void (*callback_socket_accept)(s32 listenSocketId, s32 errCode, void* customParam );  
    void (*callback_socket_read)(s32 socketId, s32 errCode, void* customParam );  
    void (*callback_socket_write)(s32 socketId, s32 errCode, void* customParam );  
}ST_SOC_Callback;
```

- **Parameters**

cb:

[in] The pointer of the socket-related callback function.

customParam:

[in] One customized parameter that can be passed into the callback functions.

5.9.3.2. Callback_Socket_Connect

This callback function is invoked by “*QL_SocketConnect*” when the return value of *QL_SocketConnect* is *SOC_WOULDBLOCK*.

- **Prototype**

```
typedef void(*callback_socket_connect)(s32 socketId, s32 errCode, void* customParam)
```

- **Parameters**

socketId:

[Out] Socket id that is returned when calling *QL_SOC_Create*.

errCode:

[Out] Error code.

customParam:

[Out] Customize parameter.

5.9.3.3. Callback_Socket_Close

This callback function will be invoked when the socket connection is closed by the remote side. This function is valid for TCP socket only. And if the socket connection is closed by the module, this function will not be invoked.

- **Prototype**

```
typedef void(*callback_socket_close)(s32 socketId, s32 errCode, void* customParam)
```

- **Parameters**

socketId:

[Out] Socket ID that is returned when calling *QL_SOC_Create*.

errCode:

[Out] Error code.

customParam:

[Out] Customize parameter.

5.9.3.4. Callback_Socket_Accept

Accept a connection on a socket when module is a server. This function is valid when the module is used as TCP server only.

- **Prototype**

```
typedef void(*callback_socket_accept)(s32 listenSocketId, s32 errCode, void* customParam)
```

- **Parameters**

listenSocketId :

[Out] Socket ID that is returned when calling QI_SOC_Create.

error_code:

[Out] Error code.

customParam:

[Out] Customize parameter.

- **Return Value**

None.

5.9.3.5. Callback_Socket_Read

This function will be invoked when received data from the socket. Then you can read the data via QI_SOC_Recv (for TCP) or QI_SOC_RecvFrom(for UDP) APIs.

- **Prototype**

```
typedef void(*callback_socket_read)(s32 socketId, s32 errCode, void* customParam)
```

- **Parameters**

socketId:

[Out] Socket ID that is returned when calling QI_SOC_Create.

error_code:

[Out] Error code.

customParam:

[Out] Customize parameter.

- **Return Value**

None.

5.9.3.6. Callback_Socket_Write

When the return value of *QI_SOC_Send* is *SOC_WOULDBLOCK*, this callback function will be invoked to enable application to continue to send TCP data.

- **Prototype**

```
typedef void(*callback_socket_write)(s32 socketId, s32 errCode, void* customParam )
```

- **Parameters**

socketId:

[Out] Socket ID that is returned when calling *QI_SOC_Create*.

errCode:

[Out] Error code.

customParam:

[Out] Customize parameter.

- **Return Value**

None.

5.9.3.7. QI_SOC_Create

This function creates a socket with the specified socket id on the specified PDP context.

- **Prototype**

```
s32 QI_SOC_Create(u8 contextId, u8 socketType)
```

- **Parameters**

contextId:

[in] PDP context ID that is specified when calling QI_GPRS_Activate. This parameter maybe is 0 or 1.

socketType :

[in] This parameter is one of "Enum_SocketType":

```
typedef enum{  
    SOCK_TCP = 0,      /* stream socket, TCP */  
    SOCK_UDP,          /* datagram socket, UDP */  
} Enum_SocketType;
```

- **Return Value**

The return value is the socket id, Otherwise, a value of "Enum_SocError" is returned. The possible returned values are as follow:

SOC_INVALID: Invalid argument.

SOC_BEARER_FAIL: Bearer is broken.

SOC_LIMIT_RESOURCE: Exceed the maximum socket number.

5.9.3.8. QI_SOC_Close

This function closes a socket.

- **Prototype**

```
s32 QI_SOC_Close(s32 socketId)
```

- **Parameters**

socketId:

[in] Socket ID that is returned when calling QI_SOC_Create.

- **Return Value**

This return value will be *SOC_SUCCESS* (0) if the function succeeds. Otherwise, a value of "Enum_SocError" is returned.

5.9.3.9. QI_SOC_Connect

This function establishes a socket connection to the host. The host is specified by an IP address and a port number. This function is used for the TCP client only. The connecting processing will take some time,

and the longest time is 75 seconds, which depends on the network quality. When the TCP socket connection succeeds, the `callback_socket_connect` callback function will be invoked.

- **Prototype**

```
s32 QI_SOC_Connect(s32 socketId, u32 remoteIP, u16 remotePort)
```

- **Parameters**

socketId:

[in] Socket ID that is returned when calling `QI_SOC_Create`.

remoteIP:

[in] Peer IPv4 address.

remotePort:

[in] Peer IPv4 port.

- **Return Value**

This return value will be `SOC_SUCCESS` (0) if the function succeeds. Otherwise, a value of “*Enum_SocError*” is returned. The possible returned values are as follow:

`SOC_SUCCESS`: This function succeeds.

`SOC_WOULDBLOCK`: The application should wait, till the `callback_socket_connect` function is called.

The application can get the information of success or failure in callback function.

`SOC_INVALID_SOCKET`: Invalid socket.

5.9.3.10. QI_SOC_ConnectEx

This function establishes a socket connection to the host. The host is specified by an IP address and a port number. This function is used for the TCP client only. The connecting processing will take some time, and the longest time is 75 seconds, which depends on the network quality. After the TCP socket connection succeeds or fails, this function returns, and the `callback_socket_connect` callback function will not be invoked.

This function supports two modes:

- **Non-blocking Mode**

When the “isBlocking” is set to `FALSE`, this function works under non-blocking mode. The result will be returned even if the operation is not done, and the result will be reported in callback.

- **Blocking Mode**

When the “isBlocking” is set to `TRUE`, this function works under blocking mode. The result will be returned only after the operation is done.

If working under non-blocking mode, this function is same as QI_SOC_Connect() functionally.

- **Prototype**

```
s32 QI_SOC_ConnectEx(s32 socketId, u32 remoteIP, u16 remotePort, bool isBlocking);
```

- **Parameters**

socketId:

[in] Socket ID that is returned when calling QI_SOC_Create.

remoteIP:

[in] Peer IPv4 address.

remotePort:

[in] Peer IPv4 port.

isBlocking

[in] Blocking mode. TRUE=blocking mode, FALSE=non-blocking mode.

- **Return Value**

This return value will be SOC_SUCCESS (0) if the function succeeds. Otherwise, a value of "Enum_SocError" is returned. The possible returned values are as follow:

SOC_SUCCESS: This function succeeds.

SOC_INVALID_SOCKET: Invalid socket.

Other values: error code, please refer to "Enum_SocErrCode".

5.9.3.11. QI_SOC_Send

This function sends data to a host which already connected previously. It is used for TCP socket only. If you call QI_SOC_Send function sends to many data to the socket buffer, this function will return SOC_WOULDBLOCK. Then you must stop sending data. After the socket buffer has enough space, the callback_socket_write callback function will be called, and you can continue to send the data. This function just sends the data to the network, whether the data received by the server is unknown. So maybe you need call QI_SOC_GetAckNumber function to check the data is received by the server.

- **Prototype**

```
s32 QI_SOC_Send(s32 socketId, u8* pData, s32 dataLen)
```

- **Parameters**

socketId:

[in] Socket ID that is returned when calling QI_SOC_Create.

pData:

[in] Pointer to the data to send.

dataLen:

[in] Number of bytes to send.

- **Return Value**

If no error occurs, "QI_SOC_Send" returns the total number of bytes sent, which can be less than the number requested to be sent in the dataLen parameter. Otherwise, a value of "Enum_SocError" is returned.

NOTES

1. The application should call "QI_SOC_Send" circularly to send data till all the data in pData are sent out. If the number of bytes actually sent is less than the number requested to be sent in the dataLen parameter, the application should keep sending out the left data.
2. If the "QI_SocketSend" returns a negative number, but not SOC_WOULDBLOCK, which indicates some error happened to the socket, the application has to close the socket by calling "QI_SocketClose" and reestablish a connection to the socket. If the return value is SOC_WOULDBLOCK, embedded application should stop sending data, and wait for the QI_Callback_socket_write() to be invoked to continue to send data.

5.9.3.12. QI_SOC_Recv

This function receives the TCP socket data from a connected or bound socket. When the TCP data comes from the network, the callback_socket_read function will be called. You can use QI_SOC_Recv to read the data cyclically until it returns 'SOC_WOULDBLOCK' in the callback function. The callback_socket_read function will be called if the new data from the network again.

- **Prototype**

```
s32 QI_SOC_Recv(s32 socketId, u8* pData, s32 dataLen)
```

- **Parameters**

socketId:

[in] Socket ID that is returned when calling QI_SOC_Create.

pData:

[Out] Point to a buffer that is the storage space for the received data.

dataLen:

[Out] Length of pData, in bytes.

- **Return Value**

If no error occurs, "QI_SOC_Recv" returns the total number of bytes received. Otherwise, a value of "Enum_SocError" is returned.

NOTES

1. The application should call "QI_SOC_Recv" circularly in the callback_socket_read function to receive data and do data processing work till the SOC_WOULDBLOCK is returned.
2. If this function returns 0, which indicates the server closed the socket, the application has to close the socket by calling "QI_SOC_Close" and reestablish a connection to the socket.
3. If the "QI_SOC_Recv" returns a negative number, but not SOC_WOULDBLOCK, which indicates some error happened to the socket, the application has to close the socket by calling "QI_SOC_Close" and reestablish a connection to the socket.

5.9.3.13. QI_SOC_GetAckNumber

This function gets the TCP socket ACK number.

- **Prototype**

```
s32 QI_SOC_GetAckNumber (s32 socketId, u64* ackNum)
```

- **Parameters**

socketId:

[in] Socket ID that is returned when calling QI_SOC_Create.

ackNum:

[Out] Point to an u64 type that is the storage space for the TCP ACK number.

- **Return Value**

If no error occurs, this return value will be SOC_SUCCESS (0). Otherwise, a value of "Enum_SocError" is returned.

5.9.3.14. QI_SOC_SendTo

This function sends data to a specific destination through UDP.

- **Prototype**

```
s32 QI_SOC_SendTo(s32 socketId, u8* pData, s32 dataLen, u32 remoteIP, u16 remotePort)
```

- **Parameters**

socketId:

[in] Socket ID that is returned when calling QI_SOC_Create.

pData:

[in] Buffer containing the data to be transmitted.

dataLen:

[in] Length of the data in pData, in bytes.

remoteIP:

[in] Pointer to the address of the target socket.

remotePort:

[in] The target port number.

- **Return Value**

If no error occurs, this function returns the number of bytes actually sent. Otherwise, a value of "Enum_SocError" is returned.

5.9.3.15. QI_SOC_RecvFrom

This function receives a datagram data through UDP socket.

- **Prototype**

```
s32 QI_SOC_RecvFrom(s32 socketId, u8* pData, s32 recvLen, u32* remoteIP, u16* remotePort)
```

- **Parameters**

socketId:

[in] Socket ID that is returned when calling QI_SOC_Create.

pData:

[Out] Buffer to store the received data.

rcvLen:

[Out] Length of pData, in bytes.

remoteIP:

[Out] An optional pointer to a buffer that receives the address of the connecting entity.

remotePort:

[Out] An optional pointer to an integer that contains the port number of the connecting entity.

- **Return Value**

If no error occurs, this function returns the number of bytes received. Otherwise, a value of “Enum_SocError” is returned.

5.9.3.16. QI_SOC_Bind

This function associates a local address with a socket.

- **Prototype**

```
s32 QI_SOC_Bind(s32 socketId, u16 localPort)
```

- **Parameters**

socketId:

[in] Socket ID that is returned when calling QI_SOC_Create.

localPort:

[in] Socket Local port number.

- **Return Value**

If no error occurs, this function returns *SOC_SUCCESS (0)*. Otherwise, a value of “Enum_SocError” is returned.

5.9.3.17. QI_SOC_Listen

This function places a socket in a state in which it is listening for an incoming connection.

- **Prototype**

```
s32 QI_SOC_Listen(s32 listenSocketId, s32 maxClientNum)
```

- **Parameters**

listenSocketId:

[in]Socket ID that is returned when calling QI_SOC_Create.

maxClientNum:

[in] Maximum connection number. Limiting the maximum length of the request queue. The maximum is 5.

- **Return Value**

If no error occurs, this function returns *SOC_SUCCESS (0)*. Otherwise, a value of “*Enum_SocError*” is returned.

5.9.3.18. QI_SOC_Accept

This function permits an incoming connection attempt on a socket. When the TCP server is started, and there is a client coming, the *callback_socket_accept* function will be called. App can call this function in the *callback_socket_accept* function to accept the connection request. The socket ID is allocated by the O.S.

- **Prototype**

```
s32 QI_SOC_Accept(s32 listenSocketId, u32 * remoteIP, u16* remotePort)
```

- **Parameters**

listenSocketId:

[in] The listen socket id.

remoteIP:

[Out] An optional pointer to a buffer that receives the address of the connecting entity.

remotePort:

[Out] An optional pointer to an integer that contains the port number of the connecting entity.

- **Return Value**

If no error occurs, this function returns a socket Id, which is greater than or equal to zero. Otherwise, a value of “*Enum_SocError*” is returned.

5.9.3.19. QI_IpHelper_GetIPByHostName

This function retrieves host IP corresponding to a host name.

● Prototype

```
s32 QI_IpHelper_GetIPByHostName (  
    u8 contextId,  
    u8 requestId  
    u8 *hostname,  
    Callback_IpHelper_GetIpByName callback_getIpByName  
)
```

```
typedef void (*Callback_IpHelper_GetIpByName)(u8 contextId, u8 requestId, s32 errCode, u32 ipAddrCnt,  
u32* ipAddr)
```

● Parameters

contextId:

[in] OpenCPU supports two PDP-contexts to the destination host at a time. This parameter can be 0 or 1.

requestId:

[Out] Embedded in response message.

hostname:

[in] The host name.

callback_getIpByName:

[in] This callback is called by Core System to notify whether this function retrieves host IP successfully or not.

errCode:

[Out] Error code if fail *ipAddrCnt:*

[Out] Get address number.

ipAddr:

[Out] The host IPv4 address.

● Return Value

If no error occurs, this return value will be *SOC_SUCCESS* (0). Otherwise, a value of “*Enum_SocError*” is returned. However, if the *SOC_WOULD_BLOCK* is returned, the application will have to wait till the “*callback_getipbyname*” is called to know whether this function retrieves host IP successfully or not.

5.9.3.20. QI_IpHelper_ConvertIpAddr

This function checks whether an IP address is valid IP address or not. If yes, each segment of the IP address string will be converted into integer to store in “*ipaddr*” parameter.

● Prototype

```
s32 s32 QI_IpHelper_ConvertIpAddr(u8 *addressstring, u32* ipaddr)
```

● Parameters

addressstring:

[in] IP address string.

ipaddr:

[Out] Pointer to u32, each byte stores the IP digit converted from the corresponding IP string.

● Return Value

The possible return values are as follow:

SOC_SUCCESS: The IP address string is a valid IP address.

SOC_ERROR: The IP address string is invalid.

SOC_INVAL: Invalid argument.

5.9.4. Possible Error Codes

The error codes are enumerated in the “*Enum_SocError*” as below.

```
typedef enum
{
    SOC_SUCCESS          = 0,
    SOC_ERROR            = -1,
    SOC_WOULDBLOCK      = -2,
    SOC_LIMIT_RESOURCE   = -3, /* limited resource */
    SOC_INVALID_SOCKET   = -4, /* invalid socket */
    SOC_INVALID_ACCOUNT  = -5, /* invalid account id */
    SOC_NAMETOOLONG      = -6, /* address too long */
    SOC_ALREADY          = -7, /* operation already in progress */
    SOC_OPNOTSUPP        = -8, /* operation not support */
    SOC_CONNABORTED      = -9, /* Software caused connection abort */
    SOC_INVAL            = -10, /* invalid argument */
    SOC_PIPE             = -11, /* broken pipe */
    SOC_NOTCONN          = -12, /* socket is not connected */
}
```

```
SOC_MSGSIZE          = -13, /* msg is too long */
SOC_BEARER_FAIL      = -14, /* bearer is broken */
SOC_CONNRESET        = -15, /* TCP half-write close, i.e., FINED */
SOC_DHCP_ERROR        = -16,
SOC_IP_CHANGED        = -17,
SOC_ADDRINUSE         = -18,
SOC_CANCEL_ACT_BEARER = -19 /* cancel the activation of bearer */
} Enum_SocErrCode;
```

5.9.5. Example

Please refer to the exmples “example_tcpclient.c”, example_udpclient.c in the SDK\example\.

5.10. Watchdog API

OpenCPU provides a software watch-dog that can monitor the applicatrion. This section describes the related APIs and demonstrates how to use them.

5.10.1. Usage

Step 1: Call QI_WTD_Start () to start the watch-dog, you need to set the interval and counter threshold.

Step 2: Call QI_WTD_Feed () to feed the watch-dog. if not call QI_WTD_Feed() within the set time (interval * 10 * allowedOverCount), the module will automatically reset.

Step 3: Call QI_WTD_Stop () to stop the watch-dog which was started previously, If you do not want to use it.

5.10.2. API Functions

5.10.2.1. QI_WTD_Start

This function starts watch-dog service.

● Prototype

```
s32 QI_WTD_Start(u32 interval, u32 allowedOverCount, s32 resetType)
```

interval:

[in] Counter which counts by step 1 every 10ms.

allowedOverCount:

[in] Counter threshold. The module will restart when the counter's value is over this threshold.

resetType:

[in] Must be zero.

- **Return Value**

QL_RET_OK: indicates success in starting watch dog service.

QL_RET_ERR_INVALID_PARAMETER: indicates the param invalid.

5.10.2.2. QI_WTD_Feed

Calling this function to feed the watch-dog, which was started by QI_WTD_Start before the end of the time.

- **Prototype**

```
void QI_WTD_Feed(void)
```

- **Parameters**

None.

- **Return Value**

None.

5.10.2.3. QI_WTD_Stop

Stop the watch-dog, which was started previously.

- **Prototype**

```
void QI_WTD_Stop(void)
```

- **Parameters**

None.

- **Return Value**

None.

5.10.3. Example

The following codes show how to use watch-dog function.

```
s32 ret;
u32 timerId=999; //Timer id is 999
u32 interval=6 * 1000; //6 seconds
bool autoRepeat=TRUE;
u32 param=555;

void Callback_Timer(u32 timerId, void* param)
{
    QI_WTD_Feed(); //Feed watch-dog once every 6 seconds.
}

//Register a stack time
ret=QI_Timer_Register(timerId, Callback_Timer, &param);
QI_Debug_Trace ("\r\n<--Register: timerId=%d, param=%d,ret=%d -->\r\n", timerId ,param,ret);

//Start a stack time
ret=QI_Timer_Start(timerId, interval, autoRepeat);
QI_Debug_Trace ("\r\n<--Start: timerId=%d,repeat=%d,ret=%d -->\r\n", timerId , autoRepeat,ret);

//Start watch-dog, If not call QI_WTD_Feed within 50times*(20*10ms)=10000ms, the module will
automatically reset.
ret=QI_WTD_Start(20, 50, 0); //20*10*50=10000ms
QI_Debug_Trace ("\r\n<-ret = %d -->\r\n", ret);
```

5.11. FOTA API

OpenCPU provides FOTA (Firmware Over The Air) function that can upgrade App remotely. The related API functions are defined & described in this section, and demonstrates how to program with FOTA.

5.11.1. Usage

Please refer to the “OPEC_CPU_FOTA_AN” document for the application notes.

5.11.2. API Functions

5.11.2.1. QI_FOTA_Init

Initialise FOTA related functions. It is a simple API. Programmer only needs to pass the simple parameters to this API.

- **Prototype**

```
s32 QI_FOTA_Init(ST_FotaConfig * pFotaCfg)
```

- **Parameters**

pFotaCfg:

[in] A pointer to to ST_FotaConfig.

```
typedef struct tagFotaConfig
{
    s16 Q_gpio_pin1;           //Watchdog GPIO pin 1, If only use one GPIO, you can set other to -1,it
                              //means invalid.
    s16 Q_feed_interval1;     //GPIO1 time interval for feed dog.
    s16 Q_gpio_pin2;           //Watchdog GPIO pin 2, If only use one GPIO, you can set other to -1, it
                              //means invalid.
    s16 Q_feed_interval2;     //GPIO 2 time interval for feed dog.
    s32 reserved1;            //Reserve 1, must be zero
    s32 reserved2;            //Reserve 2, must be zero
}ST_FotaConfig;
```

- **Return Value**

QL_RET_OK: indicates the function successes.

QL_RET_ERR_PARAM: indicates parameter error.

QI_RET_NOT_SUPPORT: indicates not support this function.

QI_RET_ERR_RAWFLASH_UNKNOW: indicates unkown error.

5.11.2.2. QI_FOTA_WriteData

This function writes the delta data of applications to the special space in the module.

- **Prototype**

```
s32 QI_FOTA_WriteData(s32 length, s8* buffer)
```

- **Parameters**

length:

[in] The length of writing (Unit: Bytes).recommend 512 bytes

buffer:

[in] A pointer to the data buffer.

- **Return Value**

QL_RET_OK: indicates this function successes.

QL_RET_ERR_PARAM: indicates parameter error.

QI_RET_NOT_SUPPORT: indicates not support this function.

QI_RET_ERR_UNKOWN: indicates unkown error.

QI_RET_ERR_RAWFLASH_OVERRANGE: indicates over flash range.

QI_RET_ERR_RAWFLASH_UNIINITIALIZED: indicates uninitialized before write or read flash.

QI_RET_ERR_RAWFLASH_UNKNOW: indicates unkown error.

QI_RET_ERR_RAWFLASH_INVALIDBLOCKID: indicates block id invalid.

QI_RET_ERR_RAWFLASH_PARAMETER: indicates parameter error.

QI_RET_ERR_RAWFLASH_ERASEFLASH: indicates erasen flash failure.

QI_RET_ERR_RAWFLASH_WRITEFLASH: indicates writen flash failure.

QI_RET_ERR_RAWFLASH_READFLASH: indicates readen flash failure.

QI_RET_ERR_RAWFLASH_MAXLENGATH: indicates the data length too large.

5.11.2.3. QI_FOTA_ReadData

This function reads data from the data region which QI_FOTA_WriteData writes to. If Developer needs to check the whole data package after writing, this API can read back the data.

- **Prototype**

```
s32 QI_FOTA_ReadData(u32 offset, u32 len, u8* pBuffer)
```

- **Parameters**

offset:

[in] The offset value to the data region

len:

[in] The length to read (Unit: Byte).recommend 512 bytes

pBuffer:

[Out] Point to the buffer to store read data.

- **Return Value**

QL_RET_ERR_PARAM: indicates parameter error.

If success, returns the real read number of bytes.

5.11.2.4. QI_FOTA_Finish

Compare calculated checksum with image checksum in the header after whole image is written.

- **Prototype**

```
s32 QI_FOTA_Finish(void)
```

- **Parameters**

None.

- **Return Value**

QL_RET_OK: indicates this function succeeded.

QI_RET_NOT_SUPPORT: indicates not support this function.

QI_RET_ERR_UNKOWN: indicates unknown error.

QI_RET_ERR_RAWFLASH_OVERRANGE: indicates over flash range.

QI_RET_ERR_RAWFLASH_UNIINITIALIZED: indicates uninitialized before write or read flash.

QI_RET_ERR_RAWFLASH_UNKNOW: indicates unknown error.

QI_RET_ERR_RAWFLASH_INVALIDBLOCKID: indicates block id invalid.

QI_RET_ERR_RAWFLASH_PARAMETER: indicates parameter error.

QI_RET_ERR_RAWFLASH_ERASEFLASH: indicates erase flash failure.

QI_RET_ERR_RAWFLASH_WRITEFLASH: indicates written flash failure.

QI_RET_ERR_RAWFLASH_READFLASH: indicates read flash failure.

QI_RET_ERR_RAWFLASH_MAXLENGATH: indicates the data length too large.

5.11.2.5. QI_FOTA_Update

Starts FOTA Update.

- **Prototype**

```
s32 QI_FOTA_Update(void);
```

- **Parameters**

None.

- **Return Value**

QL_RET_OK: indicates this function succeeded.

QL_RET_ERR_INVALID_OP: indicates invalid operation.

QI_RET_NOT_SUPPORT: indicates not support this function.

QI_RET_ERR_RAWFLASH_PARAMETER: indicates parameter error.

QI_RET_ERR_RAWFLASH_ERASEFLASH: indicates erases flash failure.

QI_RET_ERR_RAWFLASH_WRITEFLASH: indicates written flash failure.

5.11.3. Example

The following code shows how to use FOTA function.

```
static ST_FotaConfig    FotaConfig;
static u8 g_AppBinFile[64]="appbin.bin"; //File name in file system
#define READ_SIZE 512
int StartAppUpdate()
{
    int iRet=-1;
    int iFileSize=0;
    int iReadSize=0;
    int iReadLen=0;
    int hFile=-1;
    char buf[512];
    char *p=NULL;
    static int s_iSizeRem=0;

    //1. Init some param.
    QI_memset((void *)&FotaConfig, 0, sizeof(ST_FotaConfig)); //Do not enable watch_dog
    FotaConfig.Q_gpio_pin1=0;
    FotaConfig.Q_feed_interval1=100;
    FotaConfig.Q_gpio_pin2=26;
    FotaConfig.Q_feed_interval2=500;

    //2. Begin, check the Bin file.
    iRet=QI_FS_GetSize((u8 *)g_AppBinFile); //Get the size of upgrade file from file system
    if(iRet <QL_RET_OK)
```

```
{
    //The file does not exist
    return -1;
}

iRet=QL_FS_Open((u8 *)g_AppBinFile, QL_FS_READ_WRITE|QL_FS_CREATE);
if(iRet <0)
{
    //Open file failed.
    return -1;
}
hFile=iRet;//Get file handle

/*Write App bin to flash*/
iRet=QL_FOTA_Init(&FotaConfig);    //Initialise the upgrade operation
if(QL_RET_OK !=iRet)
{
    return -1;
}
QL_Debug_Trace("QL_Fota_Init OK!\r\n");

while(iFileSize > 0)
{
    QL_memset(buf, 0, sizeof(buf));
    if (iFileSize <=READ_SIZE)
    {
        iReadSize=iFileSize;
    }
    else
    {
        iReadSize=READ_SIZE;
    }
    iRet=QL_FS_Read(hFile, buf, iReadSize, &iReadLen);    //read upgrade data from file system
    if(QL_RET_OK != iRet)
    {
        QL_Debug_Trace("Read file failed!(iRet = %x)\r\n", iRet);
        return -1;
    }
    //Write upgrade data to FOTA Cache region
    iRet=QL_FOTA_WriteData(iReadSize,(s8*)buf);
    if(QL_RET_OK !=iRet)
    {
        QL_Debug_Trace("Fota write file failed!(iRet=%d)\r\n", iRet);
        return -1;
    }
}
```

```
}else
{
    s_iSizeRem +=iReadSize;
}
iFileSize -= iReadLen;
QI_Sleep(5);          //Sleep 5 ms for outputting catcher log!!!
}
QI_FS_Close(hFile);

iRet=QI_FOTA_Finish(); //Finish the upgrade operation ending with calling this API
iRet=QI_FOTA_Update(); //Update flag fields in the FOTA Cache.
if(QL_RET_OK != iRet)   //If this function succeeds, the module will automatically restart
{
    QI_Debug_Trace("[max] QI_Fota_Update failed!(iRet=%d)\r\n", iRet);
    return -1;
}
return 0;
}
```

Please refer to the “example_fota_ftp.c”, “example_fota_http.c” for the complete sample code in SDK\example\.

5.12. Debug API

The head file ql_trace.h must be included so that the debug functions can be called. All examples in OpenCPU SDK show the proper usages of these APIs.

5.12.1. Usage

There are two working modes for UART2 (DEBUG port): BASE MODE and ADVANCE MODE. Developers can config the working mode of UART2 by the “debugPortCfg” variable in the “custom_sys_cfg.c” file. See also [4.4].

```
static const ST_DebugPortCfg debugPortCfg = {
    BASIC_MODE          //Set the serial debug port (UART2) to a common serial port
    //ADVANCE_MODE      //Set the serial debug port (UART2) to a special debug port
};
```

Under basic mode, application debug messages will be output as text through UART2 port. And the UART2 port works as common serial port with RX, TX and GND. This time UART2 can be common serial port for application.

Under advance mode, both application debug messages and system debug messages will be output through UART2 port with special format. The “Catcher Tool” provided by Quectel can be used to capture and analyze these messages. Usually developer doesn’t need to use ADVANCE_MODE without the requirements from support engineer. If needed, please refer to the document "Catcher_Operation_UGD" for the usage of the special debug mode.

5.12.2. API Functions

5.12.2.1. QI_Debug_Trace

This function formats and prints a series of characters and values through the debug serial port (UART2). Its function is same as the standard “sprintf”.

● Prototype

```
s32 QI_Debug_Trace (char *fmt, ... )
```

● Parameter

format:

Point to a null-terminated multibyte string which specifies how to interpret the data. The maximum string length is **512 bytes**.

Format-control string. A format specification has the following form:

%type

type, a character that determines whether the associated argument is interpreted as a character, a string, or a number.

Table 8: Format Specification for String Print

Character	Type	Output Format
c	int	Specifies a single-byte character.
d	int	Signed decimal integer.
o	int	Unsigned octal integer.
x	int	Unsigned hexadecimal integer, using "abcdef."
f	double	Float point digit.
p	Pointer to void	Prints the address of the argument in hexadecimal digits.

- **Return Value**

Number of characters printed.

NOTES

1. The string to be printed must not be larger than the maximum number of bytes allowed in buffer; otherwise, a buffer overrun can occur.
2. The maximum allowed number of characters to output is 512.
3. To print a 64-bit integer, please first convert it to characters using “`QL_sprintf()`”, and then print the characters of the 64-bit integer.

6 Appendix

6.1. Reference

6.2. Work with Visual Studio

Suppose that the OpenCPU SDK locates E:\SDK\. Please refer to the following steps to build the Microsoft Visual Studio environment.

Step 1: Install Microsoft Visual Studio.

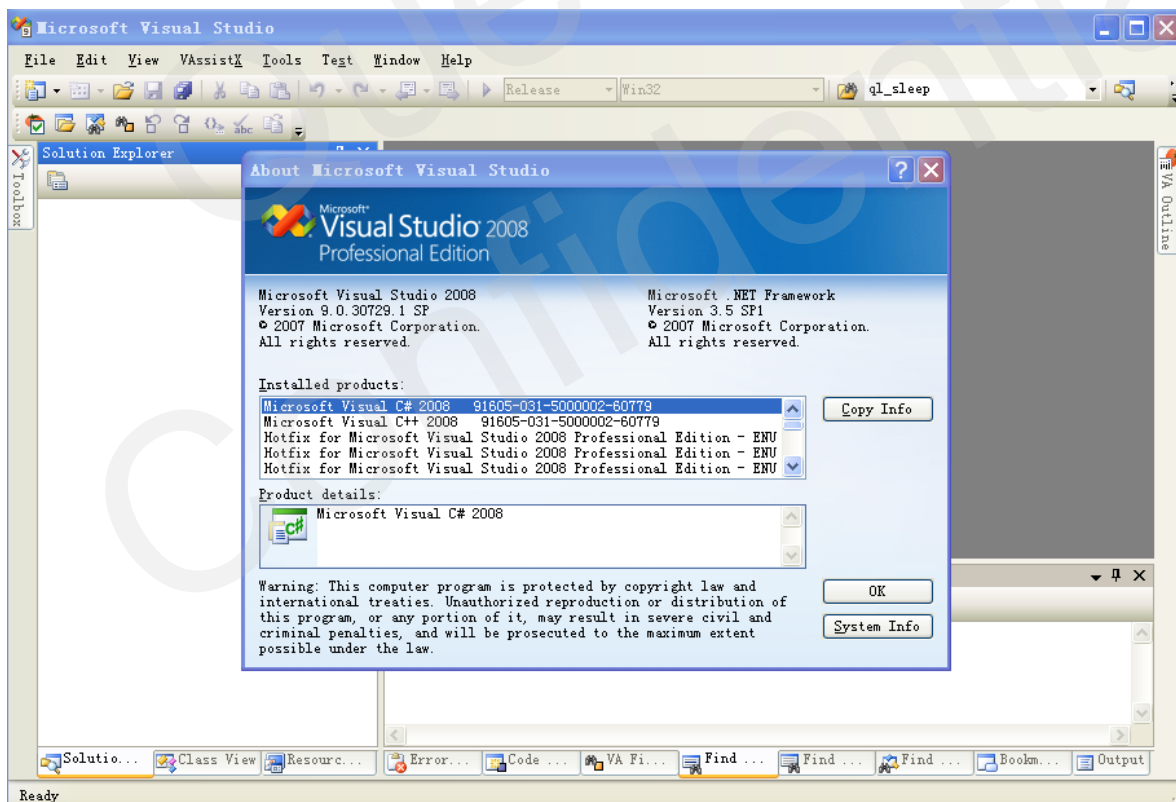

Figure 4: Install Microsoft Visual Studio

Step 2: Start with file menu, “File” → “New” → “Project from existing code...”

Step 3: Select “Visual C++” from the Combo Box, and click “Next”.

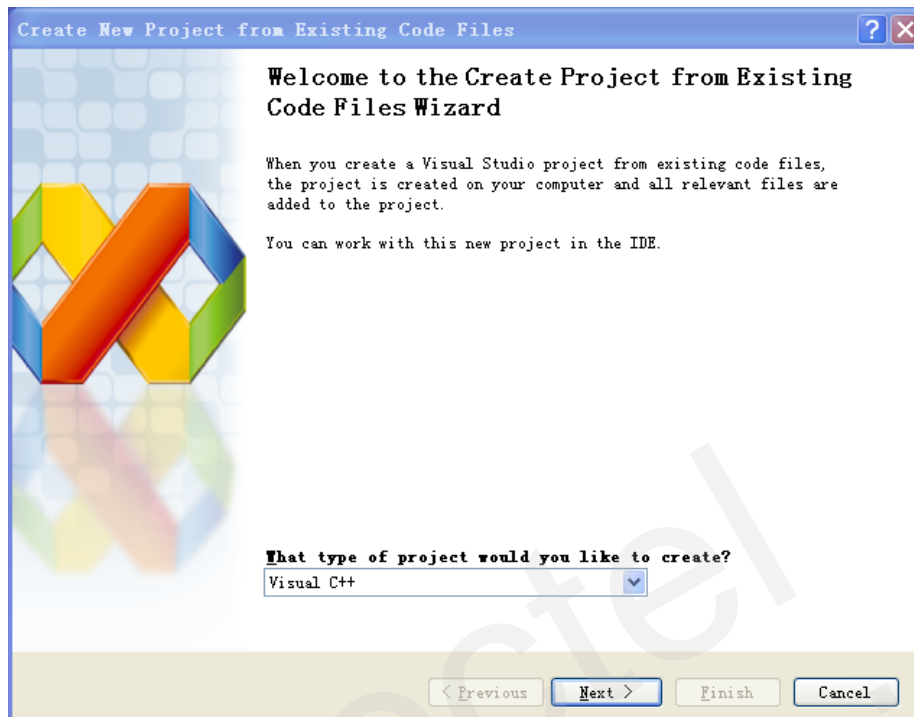

Figure 5: Visual C++

Step 4: Set the location of SDK root, and name the project, and click “Next”.

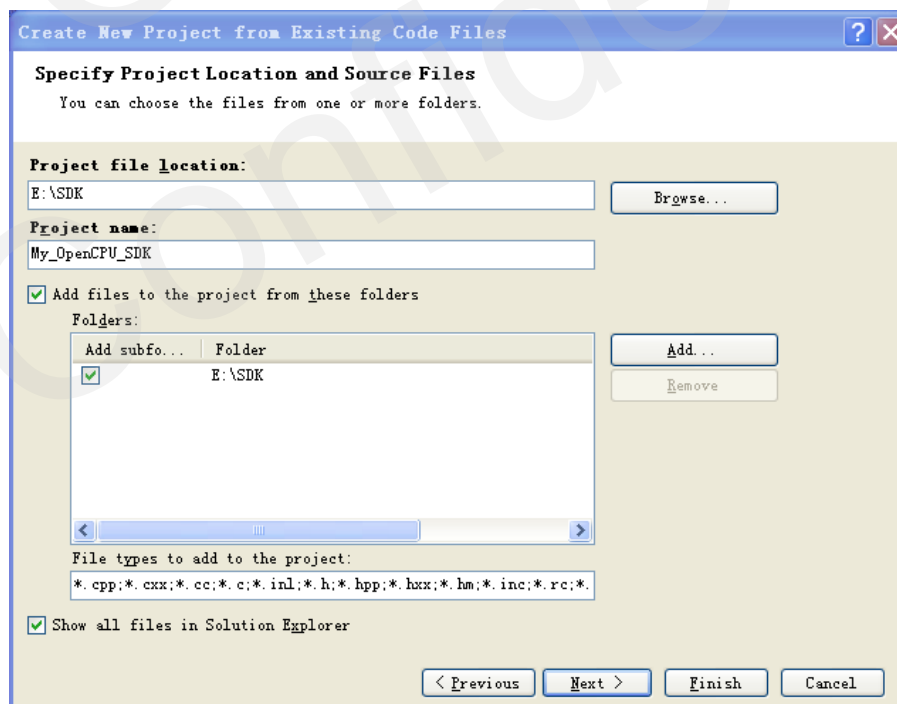

Figure 6: Location of SDK Root and Project Name

Step 5: Select “Use external build system”, and then click “Next”.

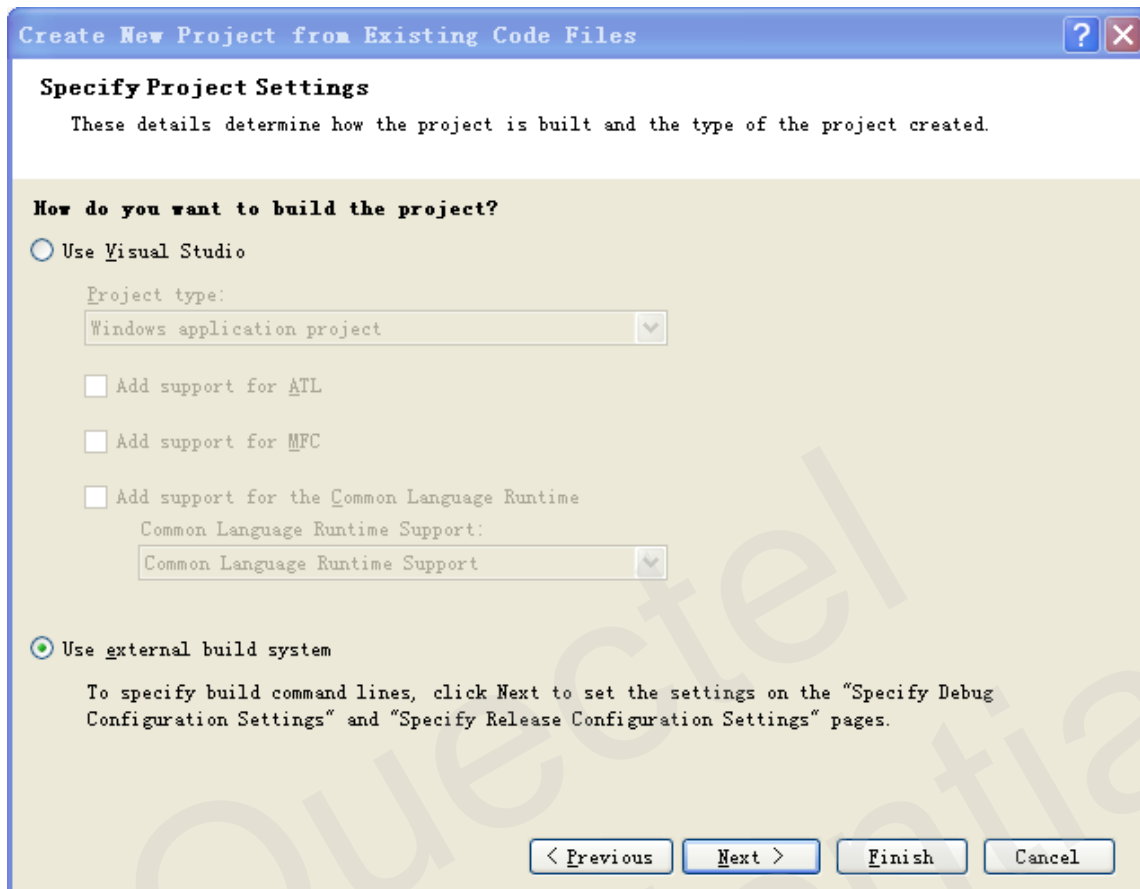

Figure 7: Use External Build System

Step 6: Set compiling command, and do other configurations. See the following screenshot. And then click “Finish”.

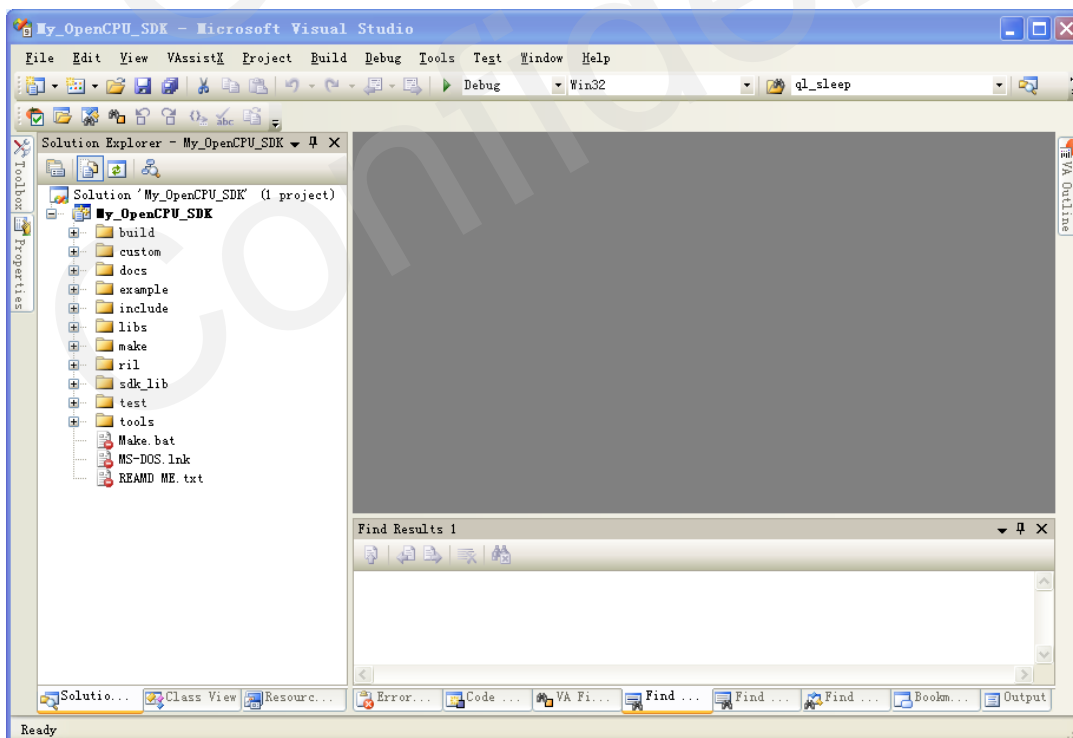

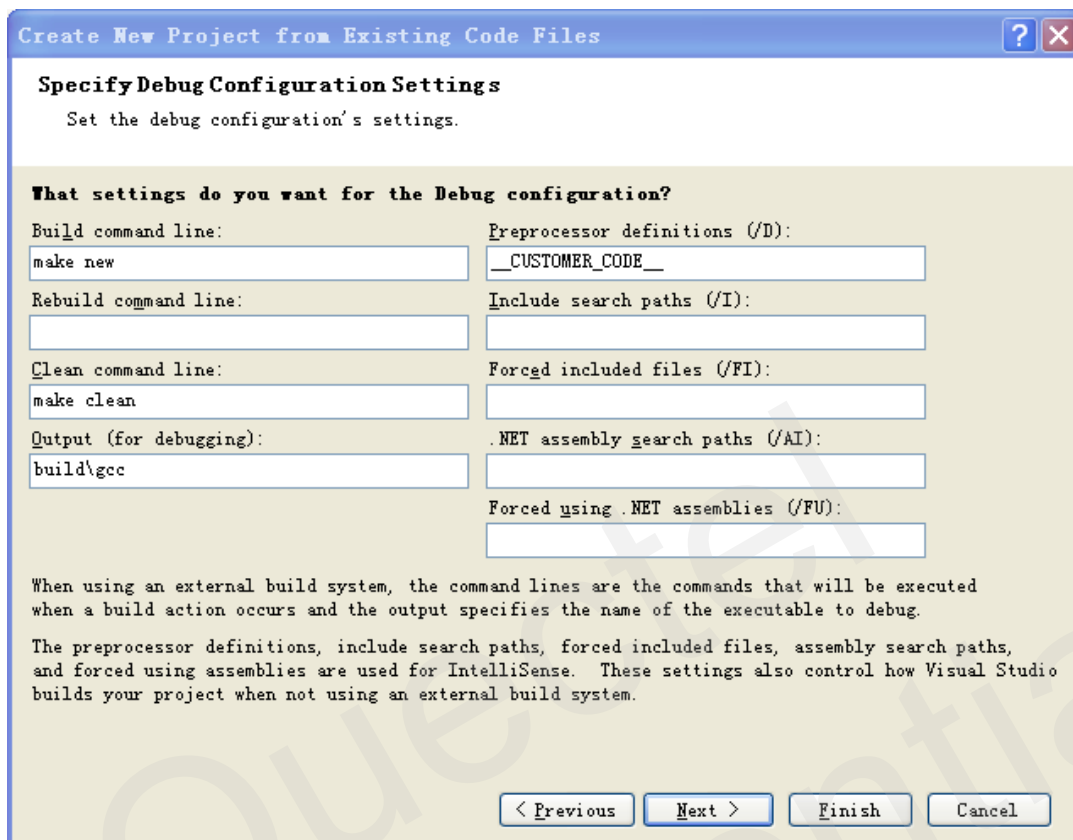

Figure 8: Project Property Setting

Now, all contents in SDK have been loaded into Visual Studio.

Step 7: “Alt+F7” opens the project property page. Please set the environment that is highlighted.

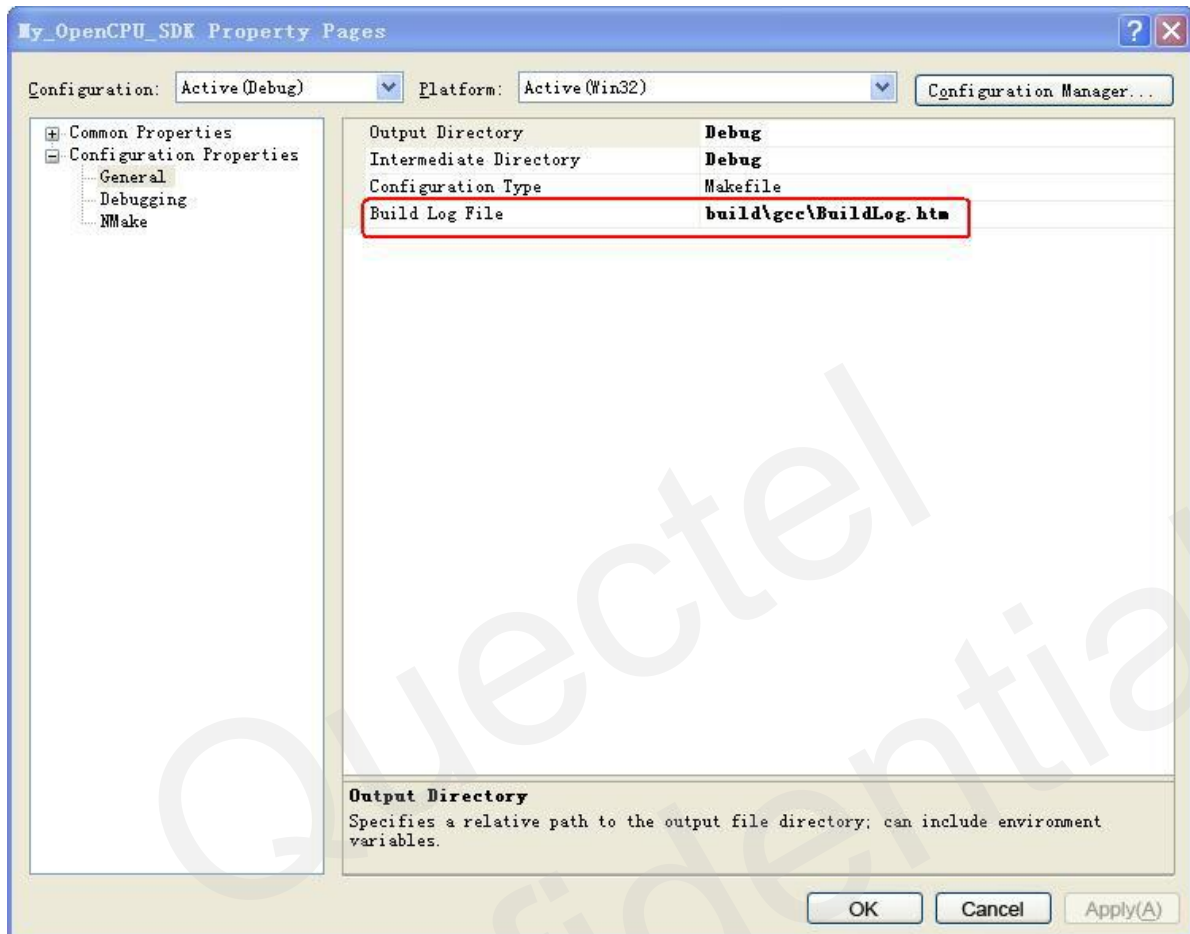

Figure 9: Project Property Page

Click “OK” to finish all configurations.

Step 8: Now start with menu bar, click “Build” → “Build My_OpenCPU_SDK” to start to compile the code. The compiling result will output from “output” window. See below.
